

## EPROMs, EEPROMs and FLASH Memory — continued

## FLASH Memory – 5V

These devices are designed to be programmed in-system with the standard system 5.0V Vcc supply. 12V Vpp is not required for program or erase operations. They can also be programmed in standard EPROM programmers. Sector erase architecture (any combination of sectors can be concurrently erased). Also supports full chip erase. 100,000 erase/program cycles. Available in DIL, PLCC and TSOP packages.

## FLASH Memory

FLASH Memory is a reliable, cost effective non-volatile digital storage device, which has the read characteristics of EPROM, SRAM and EEPROM. However, when 12V is applied to the device, it can be programmed on a byte basis, with the ability to bulk erase in a few seconds without removing the device from the system.

FLASH Memory devices are available in DIL and PLCC packages which can be socketed or mounted directly onto a board for increased reliability.
