**Functional Description**

The CY62128EV30<sup>[1]</sup> is a high performance CMOS static RAM module organized as 128K words by 8 bits. This device features advanced circuit design to provide ultra low active current. This is ideal for providing More Battery Life™ (MoBL<sup>®</sup>) in portable applications such as cellular telephones. The device also has an automatic power down feature that significantly reduces power consumption when addresses are not toggling. Placing the device into standby mode reduces power consumption by more than 99 percent when deselected ( $\overline{CE}_1$  HIGH or  $CE_2$  LOW). The eight input and output pins (I/O<sub>0</sub> through I/O<sub>7</sub>) are placed in a high impedance state when the device is deselected ( $\overline{CE}_1$  HIGH or  $CE_2$  LOW), the outputs are disabled ( $\overline{OE}$  HIGH), or a write operation is in progress ( $\overline{CE}_1$  LOW and  $CE_2$  HIGH and  $\overline{WE}$  LOW).

To write to the device, take Chip Enable ( $\overline{CE}_1$  LOW and  $CE_2$  HIGH) and Write Enable ( $\overline{WE}$ ) inputs LOW. Data on the eight I/O pins is then written into the location specified on the Address pin (A<sub>0</sub> through A<sub>16</sub>).

To read from the device, take Chip Enable ( $\overline{CE}_1$  LOW and  $CE_2$  HIGH) and Output Enable ( $\overline{OE}$ ) LOW while forcing Write Enable ( $\overline{WE}$ ) HIGH. Under these conditions, the contents of the memory location specified by the address pins appear on the I/O pins.

### Notes

10. CE is the logical combination of  $\overline{CE}_1$  and CE<sub>2</sub>. When  $\overline{CE}_1$  is LOW and CE<sub>2</sub> is HIGH,  $\overline{CE}$  is LOW; when  $\overline{CE}_1$  is HIGH or CE<sub>2</sub> is LOW,  $\overline{CE}$  is HIGH.
11. Test Conditions for all parameters other than tri-state parameters assume signal transition time of 3 ns or less (1 V/ns), timing reference levels of V<sub>CC(typ)</sub>/2, input pulse levels of 0 to V<sub>CC(typ)</sub>, and output loading of the specified I<sub>OL</sub>/I<sub>OH</sub> as shown in the "AC Test Loads and Waveforms" on page 4.
12. At any given temperature and voltage condition, t<sub>HZCE</sub> is less than t<sub>LZCE</sub>, t<sub>HZOE</sub> is less than t<sub>LZOE</sub>, and t<sub>HZWE</sub> is less than t<sub>LZWE</sub> for any given device.
13. t<sub>HZOE</sub>, t<sub>HZCE</sub>, and t<sub>HZWE</sub> transitions are measured when the output enter a high impedance state.
14. The internal write time of the memory is defined by the overlap of WE,  $\overline{CE} = V_{IL}$ . All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing should be referenced to the edge of the signal that terminates the write.

### Notes

15. The device is continuously selected.  $\overline{OE}$ ,  $\overline{CE}_1 = V_{IL}$ ,  $CE_2 = V_{IH}$ .
16.  $\overline{WE}$  is HIGH for read cycle.
17. Address valid before or similar to  $\overline{CE}_1$  transition LOW and  $CE_2$  transition HIGH.
18. Data I/O is high impedance if  $\overline{OE} = V_{IH}$ .
19. If  $\overline{CE}_1$  goes HIGH or  $CE_2$  goes LOW simultaneously with  $\overline{WE}$  HIGH, the output remains in high impedance state.
20. During this period, the I/Os are in output state. Do not apply input signals.
