## 256Kbit and 128Kbit Serial $I^{2} \mathrm{C}$ Bus EEPROM With Three Chip Enable Lines

## FEATURES SUMMARY

- Compatible with $I^{2} C$ Extended Addressing
- Two Wire $I^{2} \mathrm{C}$ Serial Interface Supports 400 kHz Protocol
■ Single Supply Voltage:
- 4.5V to 5.5V for M24xxx-B
- 2.5V to 3.6V for M24xxx-BV
- 2.5V to 5.5V for M24xxx-BW
- 1.8 V to 5.5 V for M24xxx-BR
- 1.8 V to 3.6 V for M24xxx-BS

■ Hardware Write Control
■ BYTE and PAGE WRITE (up to 64 Bytes)
■ RANDOM and SEQUENTIAL READ Modes
■ Self-Timed Programming Cycle

- Automatic Address Incrementing

■ Enhanced ESD/Latch-Up Behavior
■ More than 100,000 Erase/Write Cycles

- More than 1 Million Erase/Write cycles for the products specified in Table 22
■ More than 40 Year Data Retention

## SUMMARY DESCRIPTION

These $1^{2} \mathrm{C}$-compatible electrically erasable programmable memory (EEPROM) devices are organized as $32 \mathrm{~K} \times 8$ bits (M24256-B) and $16 \mathrm{~K} \times 8$ bits (M24128-B).

Figure 2. Logic Diagram

Table 1. Signal Names

| E0, E1, E2 | Chip Enable |
| :--- | :--- |
| SDA | Serial Data |
| SCL | Serial Clock |
| $\overline{\text { WC }}$ | Write Control |
| VCC $^{\text {VSS }}$ | Supply Voltage |

These devices are compatible with the $1^{2} \mathrm{C}$ memory protocol. This is a two wire serial interface that uses a bi-directional data bus and serial clock. The devices carry a built-in 4 -bit Device Type Identifier code (1010) in accordance with the $\mathrm{I}^{2} \mathrm{C}$ bus definition.
The device behaves as a slave in the $I^{2} \mathrm{C}$ protocol, with all memory operations synchronized by the serial clock. Read and Write operations are initiated by a Start condition, generated by the bus master. The Start condition is followed by a Device Select Code and RWW bit (as described in Table 2), terminated by an acknowledge bit.
When writing data to the memory, the device inserts an acknowledge bit during the $9^{\text {th }}$ bit time,
following the bus master's 8 -bit transmission. When data is read by the bus master, the bus master acknowledges the receipt of the data byte in the same way. Data transfers are terminated by a Stop condition after an Ack for Write, and after a NoAck for Read.

## Power On Reset: Vcc Lock-Out Write Protect

In order to prevent data corruption and inadvertent write operations during power up, a Power On Reset (POR) circuit is included. The internal reset is held active until $\mathrm{V}_{\mathrm{Cc}}$ has reached the POR threshold value, and all operations are disabled - the device will not respond to any command. In the same way, when $\mathrm{V}_{\mathrm{Cc}}$ drops from the operating voltage, below the POR threshold value, all operations are disabled and the device will not respond to any command. A stable and valid $\mathrm{V}_{\mathrm{Cc}}$ must be applied before applying any logic signal.
When the power supply is turned on, $\mathrm{V}_{\mathrm{CC}}$ rises from $\mathrm{V}_{\mathrm{ss}}$ to $\mathrm{V}_{\mathrm{CC}}(\mathrm{min})$, passing through a value $\mathrm{V}_{\text {th }}$ in between. The -V and -S versions of the device, the M24xxx-BV and M24xxx-BS, ignore all instructions until a time delay of tpu has elapsed after the moment that $\mathrm{V}_{\mathrm{CC}}$ rises above the $\mathrm{V}_{\text {th }}$ threshold. However, the correct operation of the device is not guaranteed if, by this time, $\mathrm{V}_{\mathrm{Cc}}$ is still below $\mathrm{V}_{\mathrm{CC}}(\mathrm{min})$. No instructions should be sent until the later of:

- tpu after $\mathrm{V}_{\mathrm{Cc}}$ passed the $\mathrm{V}_{\text {th }}$ threshold
- $\mathrm{V}_{\mathrm{CC}}$ passed the $\mathrm{V}_{\mathrm{CC}}(\mathrm{min})$ level

These values are specified in Table 14.

## SIGNAL DESCRIPTION

## Serial Clock (SCL)

This input signal is used to strobe all data in and out of the device. In applications where this signal is used by slave devices to synchronize the bus to a slower clock, the bus master must have an open drain output, and a pull-up resistor must be connected from Serial Clock (SCL) to $\mathrm{V}_{\text {Cc }}$. (Figure 4 indicates how the value of the pull-up resistor can be calculated). In most applications, though, this method of synchronization is not employed, and so the pull-up resistor is not necessary, provided that the bus master has a push-pull (rather than open drain) output.

## Serial Data (SDA)

This bi-directional signal is used to transfer data in or out of the device. It is an open drain output that may be wire-OR'ed with other open drain or open collector signals on the bus. A pull up resistor must be connected from Serial Data (SDA) to $\mathrm{V}_{\text {cc. }}$. (Figure 4 indicates how the value of the pull-up resistor can be calculated).

## Chip Enable (E0, E1, E2)

These input signals are used to set the value that is to be looked for on the three least significant bits (b3, b2, b1) of the 7-bit Device Select Code. These inputs must be tied to $\mathrm{V}_{\mathrm{Cc}}$ or $\mathrm{V}_{\mathrm{SS}}$, to establish the Device Select Code. When not connected (left floating), these inputs are read as Low ( $0,0,0$ ).

## Write Control (WC)

This input signal is useful for protecting the entire contents of the memory from inadvertent write operations. Write operations are disabled to the entire memory array when Write Control (WC) is driven High. When unconnected, the signal is internally read as $\mathrm{V}_{\mathrm{IL}}$, and Write operations are allowed.
When Write Control ( $\overline{\mathrm{WC}}$ ) is driven High, Device Select and Address bytes are acknowledged, Data bytes are not acknowledged.

| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

## DEVICE OPERATION

The device supports the $I^{2} \mathrm{C}$ protocol. This is summarized in Figure 5. Any device that sends data on to the bus is defined to be a transmitter, and any device that reads the data to be a receiver. The device that controls the data transfer is known as the bus master, and the other as the slave device. A data transfer can only be initiated by the bus master, which will also provide the serial clock for synchronization. The M24xxx-B device is always a slave in all communication.

## Start Condition

Start is identified by a falling edge of Serial Data (SDA) while Serial Clock (SCL) is stable in the High state. A Start condition must precede any data transfer command. The device continuously monitors (except during a Write cycle) Serial Data (SDA) and Serial Clock (SCL) for a Start condition, and will not respond unless one is given.

## Stop Condition

Stop is identified by a rising edge of Serial Data (SDA) while Serial Clock (SCL) is stable and driven High. A Stop condition terminates communication between the device and the bus master. A Read command that is followed by NoAck can be followed by a Stop condition to force the device into the Stand-by mode. A Stop condition at the end of a Write command triggers the internal EEPROM Write cycle.

## Acknowledge Bit (ACK)

The acknowledge bit is used to indicate a successful byte transfer. The bus transmitter, whether it be bus master or slave device, releases Serial Data (SDA) after sending eight bits of data. During the $9^{\text {th }}$ clock pulse period, the receiver pulls Serial

Data (SDA) Low to acknowledge the receipt of the eight data bits.

## Data Input

During data input, the device samples Serial Data (SDA) on the rising edge of Serial Clock (SCL). For correct device operation, Serial Data (SDA) must be stable during the rising edge of Serial Clock (SCL), and the Serial Data (SDA) signal must change only when Serial Clock (SCL) is driven Low.

## Memory Addressing

To start communication between the bus master and the slave device, the bus master must initiate a Start condition. Following this, the bus master sends the Device Select Code, shown in Table 2 (on Serial Data (SDA), most significant bit first).
The Device Select Code consists of a 4-bit Device Type Identifier, and a 3-bit Chip Enable "Address" (E2, E1, E0). To address the memory array, the 4bit Device Type Identifier is 1010b.
Up to eight memory devices can be connected on a single $\mathrm{I}^{2} \mathrm{C}$ bus. Each one is given a unique 3-bit code on the Chip Enable (E0, E1, E2) inputs. When the Device Select Code is received on Serial Data (SDA), the device only responds if the Chip Enable Address is the same as the value on the Chip Enable (E0, E1, E2) inputs.
The $8^{\text {th }}$ bit is the Read/ $\overline{\text { Write }}$ bit $(R \bar{W})$. This bit is set to 1 for Read and 0 for Write operations.
If a match occurs on the Device Select code, the corresponding device gives an acknowledgment on Serial Data (SDA) during the $9^{\text {th }}$ bit time. If the device does not match the Device Select code, it deselects itself from the bus, and goes into Standby mode.

Table 5. Operating Modes

| Mode | R $\bar{W}$ bit | $\bar{W}^{\mathbf{1}}$ | Bytes | Initial Sequence |
| :--- | :---: | :---: | :---: | :--- |
| Current Address Read | 1 | X | 1 | START, Device Select, $\mathrm{R} \bar{W}=1$ |
| Random Address Read | 0 | X | 1 | START, Device Select, $\mathrm{RW}=0$, Address |
|  | 1 | X |  | reSTART, Device Select, R $\bar{W}=1$ |
| Sequential Read | 1 | X | $\geq 1$ | Similar to Current or Random Address Read |
| Byte Write | 0 | $\mathrm{~V}_{\mathrm{IL}}$ | 1 | START, Device Select, $\mathrm{R} \overline{\mathrm{W}}=0$ |
| Page Write | 0 | $\mathrm{~V}_{\mathrm{IL}}$ | $\leq 64$ | START, Device Select, $\mathrm{R} \bar{W}=0$ |

Note: 1. $\mathrm{X}=\mathrm{V}_{\mathrm{IH}}$ or $\mathrm{V}_{\mathrm{IL}}$.

Figure 6. Write Mode Sequences with WC=1 (data write inhibited)

## Write Operations

Following a Start condition the bus master sends a Device Select Code with the RW bit reset to 0 . The device acknowledges this, as shown in Figure 7, and waits for two address bytes. The device responds to each address byte with an acknowledge bit, and then waits for the data byte.
Writing to the memory may be inhibited if Write Control ( $\overline{\mathrm{WC}}$ ) is driven High. Any Write instruction with Write Control ( $\overline{\mathrm{WC}}$ ) driven High (during a period of time from the Start condition until the end of the two address bytes) will not modify the memory contents, and the accompanying data bytes are not acknowledged, as shown in Figure 6.
Each data byte in the memory has a 16-bit (two byte wide) address. The Most Significant Byte (Table 3) is sent first, followed by the Least Significant Byte (Table 4). Bits b15 to b0 form the address of the byte in memory.
When the bus master generates a Stop condition immediately after the Ack bit (in the " $10^{\text {th }}$ bit" time slot), either at the end of a Byte Write or a Page

Write, the internal memory Write cycle is triggered. A Stop condition at any other time slot does not trigger the internal Write cycle.
During the internal Write cycle, Serial Data (SDA) is disabled internally, and the device does not respond to any requests.

## Byte Write

After the Device Select code and the address bytes, the bus master sends one data byte. If the addressed location is Write-protected, by Write Control (WC) being driven High, the device replies with NoAck, and the location is not modified. If, instead, the addressed location is not Write-protected, the device replies with Ack. The bus master terminates the transfer by generating a Stop condition, as shown in Figure 7.

## Page Write

The Page Write mode allows up to 64 bytes to be written in a single Write cycle, provided that they are all located in the same 'row' in the memory: that is, the most significant memory address bits
(b14-b6 for M24256-B, and b13-b6 for M24128-B) are the same. If more bytes are sent than will fit up to the end of the row, a condition known as 'rollover' occurs. This should be avoided, as data starts to become overwritten in an implementation dependent way.
The bus master sends from 1 to 64 bytes of data, each of which is acknowledged by the device if

Write Control ( $\overline{\mathrm{WC}}$ ) is Low. If Write Control ( $\overline{\mathrm{WC}}$ ) is High, the contents of the addressed memory location are not modified, and each data byte is followed by a NoAck. After each byte is transferred, the internal byte address counter (the 6 least significant address bits only) is incremented. The transfer is terminated by the bus master generating a Stop condition.

Figure 7. Write Mode Sequences with $\overline{\mathrm{WC}}=0$ (data write enabled)

Figure 8. Write Cycle Polling Flowchart using ACK

## Minimizing System Delays by Polling On ACK

During the internal Write cycle, the device disconnects itself from the bus, and writes a copy of the data from its internal latches to the memory cells. The maximum Write time ( $\mathrm{t}_{\mathrm{w}}$ ) is shown in Tables 20 and 21, but the typical time is shorter. To make use of this, a polling sequence can be used by the bus master.
The sequence, as shown in Figure 8, is:

- Initial condition: a Write cycle is in progress.
- Step 1: the bus master issues a Start condition followed by a Device Select Code (the first byte of the new instruction).
- Step 2: if the device is busy with the internal Write cycle, no Ack will be returned and the bus master goes back to Step 1. If the device has terminated the internal Write cycle, it responds with an Ack, indicating that the device is ready to receive the second part of the instruction (the first byte of this instruction having been sent during Step 1).

Figure 9. Read Mode Sequences

Note: 1. The seven most significant bits of the Device Select Code of a Random Read (in the $1^{\text {st }}$ and $4^{\text {th }}$ bytes) must be identical.

## Read Operations

Read operations are performed independently of the state of the Write Control (WC) signal.

## Random Address Read

A dummy Write is performed to load the address into the address counter (as shown in Figure 9) but without sending a Stop condition. Then, the bus master sends another Start condition, and repeats the Device Select Code, with the RW bit set to 1. The device acknowledges this, and outputs the contents of the addressed byte. The bus master must not acknowledge the byte, and terminates the transfer with a Stop condition.

## Current Address Read

The device has an internal address counter which is incremented each time a byte is read. For the Current Address Read operation, following a Start condition, the bus master only sends a Device Select Code with the RW bit set to 1 . The device acknowledges this, and outputs the byte addressed by the internal address counter. The counter is then incremented. The bus master terminates the transfer with a Stop condition, as shown in Figure 9, without acknowledging the byte.

## Sequential Read

This operation can be used after a Current Address Read or a Random Address Read. The bus
master does acknowledge the data byte output, and sends additional clock pulses so that the device continues to output the next byte in sequence. To terminate the stream of bytes, the bus master must not acknowledge the last byte, and must generate a Stop condition, as shown in Figure 9.
The output data comes from consecutive addresses, with the internal address counter automatically incremented after each byte output. After the last memory address, the address counter 'rolls-over', and the device continues to output data from memory address 00h.

## Acknowledge in Read Mode

For all Read commands, the device waits, after each byte read, for an acknowledgment during the $9^{\text {th }}$ bit time. If the bus master does not drive Serial Data (SDA) Low during this time, the device terminates the data transfer and switches to its Standby mode.

## INITIAL DELIVERY STATE

The device is delivered with the memory array erased: all bits are set to 1 (each byte contains FFh).

## MAXIMUM RATING

Stressing the device above the rating listed in the Absolute Maximum Ratings" table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not im-
plied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

Table 6. Absolute Maximum Ratings

## DC AND AC PARAMETERS

This section summarizes the operating and measurement conditions, and the DC and AC characteristics of the device. The parameters in the DC and AC Characteristic tables that follow are derived from tests performed under the Measure-
ment Conditions summarized in the relevant tables. Designers should check that the operating conditions in their circuit match the measurement conditions when relying on the quoted parameters.

Table 20. AC Characteristics (M24xxx-B, M24xxx-BW)

| Test conditions specified in Table 12 and Table 7 or 9 |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Symbol | Alt. | Parameter | Min. | Max. | Unit |
| $f_{c}$ | $\mathrm{f}_{\text {SCL }}$ | Clock Frequency |  | 400 | kHz |
| tchcl | tHIGH | Clock Pulse Width High | 600 |  | ns |
| tclch | tow | Clock Pulse Width Low | 1300 |  | ns |
| $\mathrm{t}_{\mathrm{CH1CH2}}$ | $\mathrm{t}_{\mathrm{R}}$ | Clock Rise Time |  | 300 | ns |
| $\mathrm{t}_{\text {CLICL2 }}$ | $\mathrm{t}_{\mathrm{F}}$ | Clock Fall Time |  | 300 | ns |
| $\mathrm{t}_{\text {DH1DH2 }}{ }^{2}$ | $t_{R}$ | SDA Rise Time | 20 | 300 | ns |
| $\mathrm{t}_{\text {DL1DL2 }}{ }^{2}$ | $\mathrm{t}_{\mathrm{F}}$ | SDA Fall Time | 20 | 300 | ns |
| toxcx | tsu:dat | Data In Set Up Time | 100 |  | ns |
| tcLDx | $t_{\text {HD: }}$ DAT | Data In Hold Time | 0 |  | ns |
| tcLax | $\mathrm{t}_{\mathrm{DH}}$ | Data Out Hold Time | 200 |  | ns |
| $\mathrm{tcLQv}^{3}$ | $\mathrm{t}_{\text {AA }}$ | Clock Low to Next Data Valid (Access Time) | 200 | 900 | ns |
| $\mathrm{t}_{\text {ChDx }}{ }^{1}$ | $\mathrm{t}_{\text {su:Sta }}$ | Start Condition Set Up Time | 600 |  | ns |
| $t_{\text {DLCL }}$ | $t_{\text {HD: }}$ STA | Start Condition Hold Time | 600 |  | ns |
| $\mathrm{t}_{\text {chin }}$ | $\mathrm{t}_{\text {su:sto }}$ | Stop Condition Set Up Time | 600 |  | ns |
| $t_{\text {DHDL }}$ | $t_{\text {buF }}$ | Time between Stop Condition and Next Start Condition | 1300 |  | ns |
| tw | twr | Write Time |  | $\begin{gathered} 10 \\ o r^{4} 5 \end{gathered}$ | ms |

Note: 1. For a reSTART condition, or following a Write cycle.
2. Sampled only, not $100 \%$ tested.
3. To avoid spurious START and STOP conditions, a minimum delay is placed between SCL=1 and the falling or rising edge of SDA.
4. The Write Time of 5 ms only applies to $\mathrm{M} 24128-\mathrm{B}$ and $\mathrm{M} 24128-\mathrm{BW}$ devices bearing the process letter "B" in the package marking (on the top side of the package, on the right side), otherwise the Write Time is 10 ms . For further details, please contact your nearest ST sales office, and ask for a copy of the M24128 Product Change Notice.

## M24256-B, M24128-B

## PART NUMBERING

## Table 22. Ordering Information Scheme

## Option

T = Tape \& Reel Packing

Note: 1. Available for the M24256-B only.
2. Available for the M24128-B only.
3. M24256-B and M24256-BW bearing the process letter " $V$ " in the package marking, and M24128-B and M24128-BW bearing the process letter " B " in the package marking (on the top side of the package, on the right side), guarantee more than 1 million Erase/ Write cycle endurance. For more information about these devices, and their device identification, please contact your nearest ST sales office, and ask for the Product Change Notice.

For a list of available options (speed, package, etc.) or for further information on any aspect of this
device, please contact your nearest ST Sales Office.

## REVISION HISTORY

Table 23. Document Revision History

| Date | Rev. | Description of Revision |
| :---: | :---: | :--- |
| 28-Dec-1999 | 2.1 | TSSOP8 package added |
| 24-Feb-2000 | 2.2 | E2, E1, E0 must be tied to Vcc or Vss <br> Low Pass Filter Time Constant changed to Glitch Filter |
| 22-Nov-2000 | 2.3 | -V voltage range added |
| 30-Jan-2001 | 2.4 | -V voltage range changed to 2.5V to 3.6V <br> Lead Soldering Temperature in the Absolute Maximum Ratings table amended <br> Write Cycle Polling Flow Chart using ACK illustration updated. SO8(wide) package added <br> References to PSDIP8 changed to PDIP8, and Package Mechanical data updated |
| 01-Jun-2001 | 2.5 | -R voltage range added. Package mechanical data updated for TSSOP8 and TSSOP14 <br> packages according to JEDECLMO-153 <br> Document promoted from "Preliminary Data" to "Full Data Sheet" |
| 16-Oct-2001 | 2.6 | TSSOP14 package removed <br> Absolute Max Ratings and DC characteristics updated for M24256-BV |
| 09-Nov-2001 | 2.7 | Specification of Test Condition for Leakage Currents in the DC Characteristics table improved |
| 21-Mar-2002 | 2.8 | 1 million Erase/Write cycle endurance for M24256-B and M24256-BW products with process <br> letter "V" |
| 18-Oct-2002 | 3.0 | Document reformatted. Parameters changed are: 1 million Erase/Write cycle endurance and 5 <br> ms write time for M24128-B and M24128-BW products with process letter "B". |
| 20-Nov-2002 | 3.1 | Superfluous (and incorrectly present) 100kHz AC Characteristics table for M24256-BR <br> removed. |
| 02-Jun-2003 | 3.2 | Initial delivery state specified. -R and -S ranges are no longer Preliminary Data. Package <br> mechanical data for unavailable package removed. |
