

TPS65930/TPS65920

Integrated Power Management

Audio Codec (TPS65930 Only)

Silicon Revision 1.0

Data Manual

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

Literature Number: SWCS037E
May 2008–Revised October 2009

Integrated Power Management Audio Codec (TPS65930 Only)

Check for Samples: [TPS65930/TPS65920](#)

1 Introduction

The TPS65920/TPS65930 devices are power-management ICs for OMAP™ and other mobile applications. The devices include power-management, a universal serial bus (USB) high-speed (HS) transceiver, light-emitting diode (LED) drivers, an analog-to-digital converter (ADC), a real-time clock (RTC), and embedded power control (EPC). In addition, the TPS65930 includes a full audio codec with two digital-to-analog converters (DACs) and two ADCs to implement dual voice channels, and a stereo downlink channel that can play all standard audio sample rates through a multiple format inter-integrated sound (I2S™)/time division multiplexing (TDM) interface.

These optimized devices support the power and peripheral requirements of the OMAP application processors. The power portion of the devices contains three buck converters, two controllable by a dedicated SmartReflex™ class-3 interface, multiple low dropout (LDO) regulators, an EPC to manage the power sequencing requirements of OMAP, and an RTC and backup module. The RTC can be powered by a backup battery when the main supply is not present, and the devices include a coin-cell charger to recharge the backup battery as needed.

The USB module provides a HS 2.0 OTG transceiver suitable for direct connection to the OMAP UTMI+ low pin interface (ULPI), with an integrated charge pump and full support for the carkit CEA-936A specification. An ADC is provided for monitoring signals, such as supply voltage, entering the device, and two additional external ADC inputs are provided for system use.

The devices provide driver circuitry to power two LED circuits that can illuminate a panel or provide user indicators. The drivers also provide pulse width modulation (PWM) circuits to control the illumination levels of the LEDs. A keypad interface implements a built-in scanning algorithm to decode hardware-based key presses and reduce software use, with multiple additional general-purpose input/output devices (GPIOs) that can be used as interrupts when configured as inputs.

This TPS65920/TPS65930 data manual presents the electrical and mechanical specifications for the TPS65920 and TPS65930 devices. It covers the following topics:

- TPS65920/TPS65930 terminals: Assignment, multiplexing, electrical characteristics, and functional description (see [Section 2, Terminal Description](#))
- Electrical characteristic requirements: Maximum and recommended operating conditions, digital input/output (I/O) characteristics (see [Section 3, Electrical Characteristics](#))
- Power module: Power provider, power references, power control, power consumption, and power management, with the on and off sequence (see [Section 4, Power Module](#))
- RTC and EPC (see [Section 5, Real-Time Clock and Embedded Power Controller](#))
- Audio/voice module (TPS65930 device only): Electrical characteristics and application schematics for the downlink and uplink paths (see [Section 6, Audio/Voice Module \(TPS65930 Device Only\)](#))
- Various modules: USB transceiver, monitoring analog-to-digital converter (MADC), LED drivers, and keyboard (see [Section 8, MADC](#), [Section 9, LED Driver](#), and [Section 10, Keyboard](#))
- Clock specifications: Clock slicer; input and output clocks (see [Section 11, Clock Specifications](#))
- Timing requirements and switching characteristics (ac timings) of the interfaces (see [Section 12, Timing Requirements and Switching Characteristics](#))
- Debouncing time (see [Section 13, Debouncing Time](#))
- External components for the application schematics (see [Section 14, External Components](#))
- Thermal resistance characteristics, device nomenclature, and mechanical data about the available packaging (see [Section 15, TPS65920/TPS65930 Package](#))

- Glossary of acronyms and abbreviations used in this data manual (see [Section 16, Glossary](#))

1.1 Features

The TPS65930 and TPS65920 devices offer the following features:

- Power:
 - Three efficient stepdown converters
 - Four external linear LDOs for clocks and peripherals
 - SmartReflex dynamic voltage management
- Audio (TPS65930 device only):
 - Differential input main microphones
 - Mono auxiliary/FM input
 - External predrivers for class D (stereo)
 - TDM interface
 - Automatic level control (ALC)
 - Digital and analog mixing
 - 16-bit linear audio stereo DAC (96, 48, 44.1, and 32 kHz and derivatives)
 - 16-bit linear audio stereo ADC (48, 44.1, and 32 kHz and derivatives)
 - Carkit
- USB:
 - USB 2.0 on-the-go (OTG)-compliant HS transceivers
 - 12-bit universal transceiver macro interface ULPI
 - USB power supply (5-V charge pump for VBUS)
 - Consumer Electronics Association (CEA)-2011: OTG transceiver interface specification
 - CEA-936A: Mini-USB analog carkit specification
- Additional Features:
 - LED driver circuit for two external LEDs
 - Two external 10-bit MADC inputs
 - Real-time clock (RTC) and retention modules
 - HS I²C serial control
 - Thermal shutdown and hot-die detection
 - Keypad Interface (up to 6 × 6)
 - External vibrator control
 - 15 GPIOs
 - 0.65 mm pitch, 139 pin, 10 × 10 mm package
- Charger:
 - Backup battery charger

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

1.2 TPS65920 and TPS65930 Device Block Diagrams

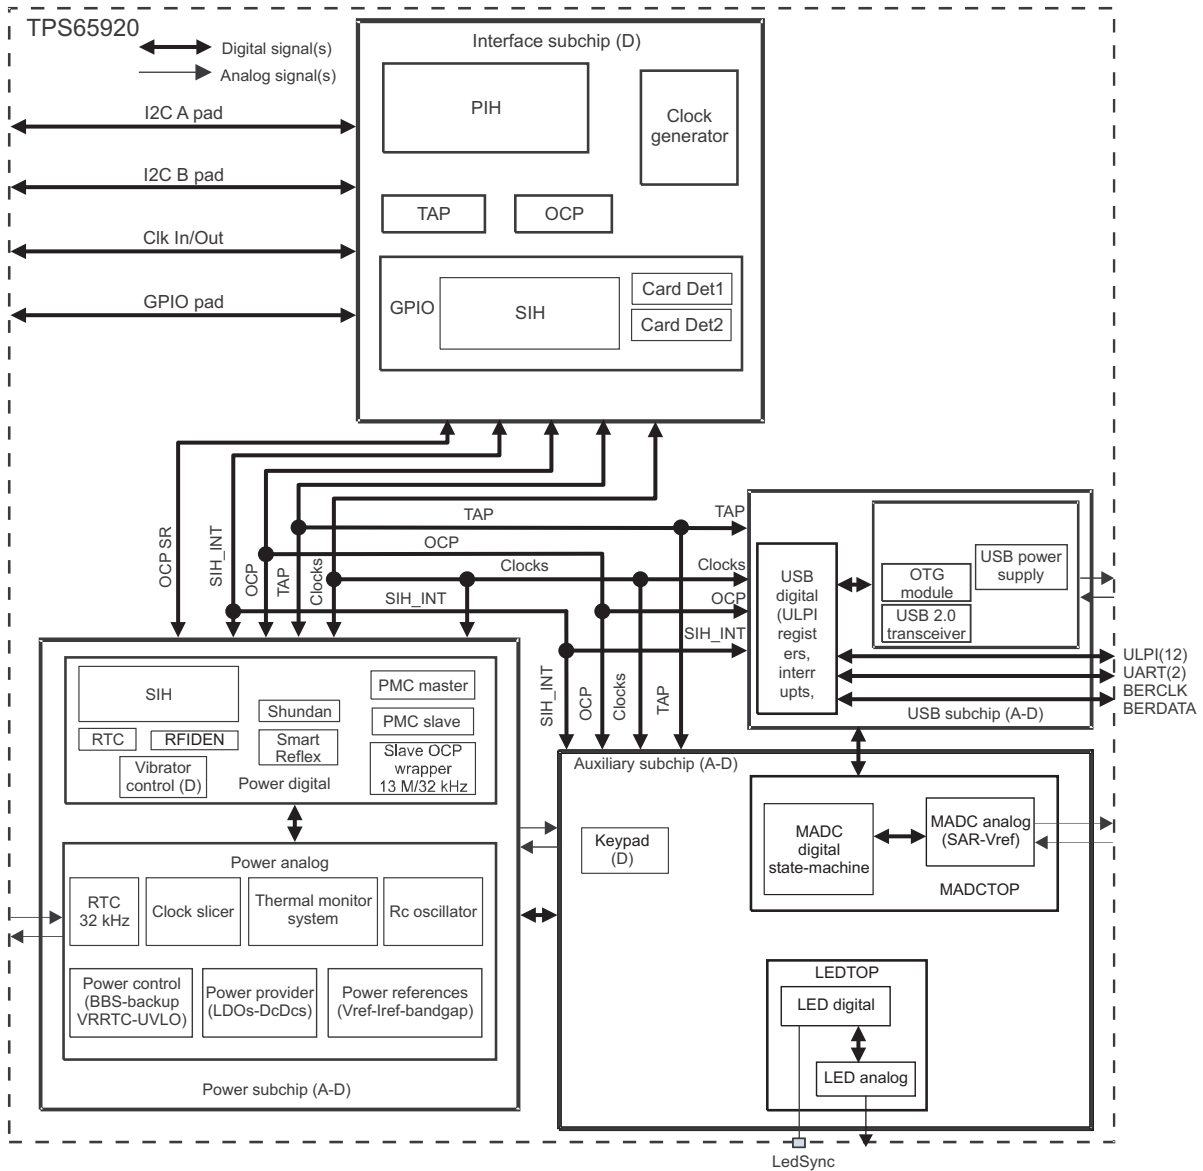

Figure 1-1. TPS65920 Block Diagram

037-002

Figure 1-2. TPS65930 Block Diagram

2 Terminal Description

Figure 2-1 shows the ball locations for the 139 -ball plastic ball grid array (PBGA) package. Use this array with Table 2-1 to locate signal names and ball grid numbers.

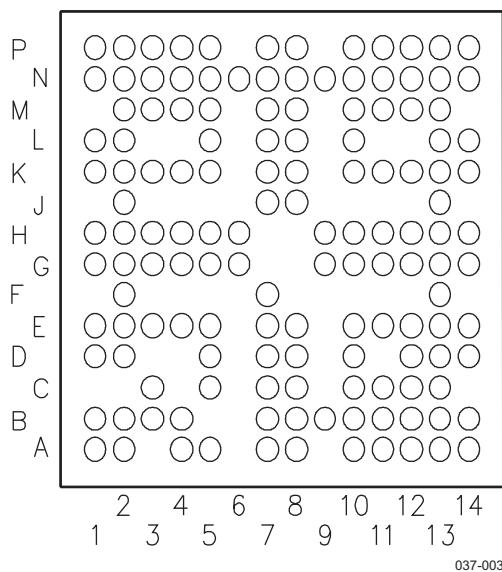

Figure 2-1. PBGA Bottom View

2.1 Ball Characteristics

Table 2-1 describes the terminal characteristics and the signals multiplexed on each pin. The following list describes the table column headers:

1. Ball: Ball number(s) associated with each signal(s)
2. Pin Name: The names of all the signals that are multiplexed on each ball
3. A/D: Analog or digital signal
4. Type: The terminal type when a particular signal is multiplexed on the terminal:
 - I = Input
 - O = Output
5. Reference Level: See the power module chapter for values.
6. PU/PD: Denotes the presence of an internal pullup or pulldown. Pullups and pulldowns can be enabled or disabled by software.
7. Buffer Strength: Drive strength of the associated output buffer

Table 2-1. Ball Characteristics

- (1) To avoid reflection on this pin as a result of impedance mismatch, a serial resistance of 33 Ω must be added. This clock output is available in TPS65920 also. Can be used as a clock source, if required.
- (2) Balls A7, A8, D1, D2, E1, E2, G1, H3, K2, K3, and K4 are present on TPS65920 package. However, there is no function associated with these pins. These can be left floating.

Table 2-1. Ball Characteristics (continued)

TPS65920 Ball[1]	TPS65930 Ball[1]	Pin Name[2]	A/D [3]	Type[4]	Reference Level RL[5]	PU[6] (kΩ)			PD[6] (kΩ)			Buffer Strength (mA)[7]

2.2 Signal Description

Table 2-2 describes the signals on the TPS65920 and TPS65930 devices; some signals are available on multiple pins.

Table 2-2. Signal Description

Module	Signal Name	Description	Type	TPS65920 Ball	TPS65930 Ball	Default Configuration After Reset Released			Features Not Used ⁽¹⁾
						Signal	Type	Internal Pull or Not	
ADC	ADCIN0	Battery type	I/O	H2	H2	ADCIN0			GND
	ADCIN2	General-purpose ADC input	I	F2	F2	ADCIN2	I		GND
Charger	PCHGAC	AC precharge sense signal. Also used for EEPROM.	I	M5	M5	PCHGAC	I		GND
	VPRECH	Precharge regulator output	O	N1	N1	VPRECH	O		Cap to GND ⁽²⁾
	VBAT	Battery voltage sensing	Power	N5	N5	VBAT	Power		VBAT
GPIOs/ JTAG	GPIO0/CD1	GPIO0/card detection 1	I/O	F7	F7	GPIO0	I	PD	Floating
	JTAG.TDO	JTAG test data output	I/O						
	GPIO1	GPIO1	I/O	E7	E7	GPIO1	I	PD	Floating
	JTAG.TMS	JTAG test mode state	I						
	GPIO2	GPIO2	I/O	P2	P2	GPIO2	I	PD	Floating
	TEST1	TEST1 pin used in test mode only	I/O						
	GPIO15	GPIO15	I/O						
	TEST2	TEST2 pin used in test mode only	I/O	P13	P13	GPIO15	I	PD	Floating
	GPIO6	GPIO6	I/O						
	PWM0	Pulse width driver 0	O	L5	L5	GPIO6	I	PD	Floating
	TEST3	TEST3 pin used in test mode only (controlled by JTAG)	I/O						
	GPIO7	GPIO7	I/O						
	VIBRA.SYNC	Vibrator on-off synchronization	I	J7	J7	GPIO7	I	PD	Floating
PWM1	Pulse width driver	O							
TEST4	TEST4 pin used in test mode only (controlled by JTAG)	I/O							

Table 2-2. Signal Description (continued)

Module	Signal Name	Description	Type	TPS65920 Ball	TPS65930 Ball	Default Configuration After Reset Released			Features Not Used ⁽¹⁾
						Signal	Type	Internal Pull or Not	
CONTROL	SYSEN	System enable output	Open drain/I	D8	D8	SYSEN	OD	PU	Floating
	CLKEN	Clock enable	O	A4	A4	CLKEN	O		Floating
	CLKREQ	Clock request	I	B13	B13	CLKREQ	I	PD	GND
	INT1	Output interrupt line 1	O	C10	C10	INT1	O		Floating
	NRESPWRON	Output control the NRESPWRON of the application processor	O	C8	C8	NRESPWRON	O		Floating
	NRESWARM	Input; detect user action on the reset button	I	B9	B9	NRESWARM	I		GND
	PWRON	Input; detect a control command to start or stop the system	I	D10	D10	PWRON	I		VBAT
	NSLEEP1	Sleep request from device 1	I	G5	G5	NSLEEP1	I		GND
	CLK256FS		O	E10	E10	CLK256FS	O		Floating
	VMODE1	Digital voltage scaling linked with VDD1	I	E4	E4	VMODE1	I		GND
	BOOT0	Boot pin 0	I	E8	E8	BOOT0	I	PD	N/A
	BOOT1	Boot pin 1	I	D7	D7	BOOT1	I	PD	N/A
	REGEN	Enable signal for external LDO	Open drain	B8	B8	REGEN	OD	PU	Floating
MSECURE	Security and digital rights management	I	H4	H4	MSECURE	I		N/A	
VREF	VREF	Reference voltage	Power	L13	L13	VREF	Power		N/A
	AGND	Analog ground for reference voltage	Power GND	K13	K13	AGND	Power GND		GND
I ² C Smart Reflex	N.C.	Not connected		B3	B3	Signal not functional ⁽³⁾			Floating
	I2C.SR.SDA	SmartReflex I ² C data	I/O						
	VMODE2	Digital voltage scaling linked with VDD2	I	C5	C5				
I ² C	I2C.SR.SCL	SmartReflex I ² C data	I/O						
	I2C.CNTL.SDA	General-purpose I ² C data	I/O	C3	C3	I2C.CNTL.SDA	I/O	PU	N/A
TDM	I2C.CNTL.SCL	General-purpose I ² C clock	I/O	B4	B4	I2C.CNTL.SCL	I/O	PU	N/A
	I2S.CLK	Clock signal (audio port)	I/O		H3	I2S.CLK	I/O		Floating
	I2S.SYNC	Synchronization signal (audio port)	I/O		K2	I2S.SYNC	I/O		Floating
	I2S.DIN	Data receive (audio port)	I		K4	I2S.DIN	I		GND
ANA.MIC	I2S.DOUT	Data transmit (audio port)	O		K3	I2S.DOUT	O		Floating
	MIC.MAIN.P	Main microphone left input (P)	I		D1	MIC.MAIN.P	I		Cap to GND
Hands-Free	MIC.MAIN.M	Main microphone left input (M)	I		E1	MIC.MAIN.M	I		Cap to GND
	VBAT.RIGHT	Battery voltage input	Power	A10	A10	VBAT.RIGHT	Power		VBAT
Headset	PreDrv.LEFT	Predriver output left P for external class-D amplifier	O		A7	VMID	Power		Floating
	VMID		Power						
	PreDrv.RIGHT	Predriver output right P for external class-D amplifier	O		A8	ADCIN7	I		GND
	ADCIN7	General-purpose ADC input 7	I						
AUX Input	AUXR	Auxiliary audio input right	I		G1	AUXR	I		Cap to GND

Table 2-2. Signal Description (continued)

Module	Signal Name	Description	Type	TPS65920 Ball	TPS65930 Ball	Default Configuration After Reset Released			Features Not Used ⁽¹⁾	
						Signal	Type	Internal Pull or Not		
VMIC BIAS	MICBIAS1.OUT	Analog microphone bias 1	Power		E2	MICBIAS1.OUT	Power		Floating	
	VMIC1.OUT	Digital microphone power supply 1	Power							
	MICBIAS.GND	Dedicated ground for microphones	Power GND		D2	MICBIAS.GND	Power GND		GND	
	AVSS1	Analog ground	Power GND		G2	G2	AVSS1	Power GND		GND
	AVSS2			L7	L7	AVSS2				
	AVSS3			N14	N14	AVSS3				
AVSS4	C7			C7	AVSS4					
CLOCK	32KCLKOUT	Buffered output of the 32-kHz digital clock	O	M10	M10	32KCLKOUT	O		Floating	
	32KXIN	Input of the 32-kHz oscillator	I	L14	L14	32KXIN	I		N/A	
	32KXOUT	Output of the 32-kHz oscillator	O	K14	K14	32KXOUT	O		Floating	
	HFCLKIN	Input of the digital (or sine) HS clock	I	A11	A11	HFCLKIN	I		N/A	
	HFCLKOUT	HS clock output	O	M11	M11	HFCLKOUT	O		Floating	
USB PHY	VBUS	VBUS power rail	Power	P8	P8	VBUS	Power		N/A	
	DP/UART3.RXD	USB data P/USB carkit receive data/universal asynchronous receiver/transmitter (UART)3 receive data	I/O	N10	N10	DP/UART3.RXD	I/O		N/A

(1) This column provides the connection when the associated feature is not used or not connected. When there is a pin muxing, not all functions on the muxed pin are used. But even if a function is not used, the Default Configuration After Reset Released column still applies.

Connection criteria:

- Analog pins:
 - For input: GND
 - For output: Floating (except VPRECH is connected to GND)
 - For I/O if input by default: GND (except for audio features input: capacitor to ground with a 100-nF typical value capacitor)
- Digital pins:
 - For input: GND (except keypad and STP are left floating)
 - For input and pullup: Floating
 - For output: Floating
 - For I/O and pullup: Floating

N/A (not applicable): When the associated feature is mandatory for correct functioning of the TPS65920/TPS65930 device

(2) The signal VPRECH must be connected to the CPRECH capacitor to GND.

(3) Signal not functional indicates that no signal is presented on the pad after a release reset.

3 Electrical Characteristics

3.1 Absolute Maximum Ratings

Table 3-1 lists the absolute maximum ratings.

Table 3-1. Absolute Maximum Ratings

Parameter	Test Conditions	Min	Typ	Max	Unit
Main battery supply voltage ⁽¹⁾		2.1		4.5	V
Voltage on any input	Supply represents the voltage applied to the power supply pin associated with the input	0.0		1.0*Supply	V
Storage temperature range		-55		125	°C
Ambient temperature range		-40		85	°C
Junction temperature (T _J)	At 1.4 W (Theta JB 11°C/W 2S2P board)			105	°C
Junction temperature (T _J) for parametric compliance		-40		105	°C

(1) The product has negligible reliability impact if voltage spikes of 5.2 V occur for a total duration of 10 milliseconds.

3.2 Minimum Voltages and Associated Currents

Table 3-2 lists the VBAT minimum and maximum currents per VBAT ball.

Table 3-2. VBAT Minimum Required Per VBAT Ball and Associated Maximum Current

Category	Pin and Module	Maximum Current Specified (mA)	Output Voltage (V)	VBAT Minimum (V)
VBAT pin name	VDD_VPLLA3R_IN_6POV	340		
Internal module supplied	VPLL1 (LDO)	40	1.0 / 1.2 / 1.3 / 1.8 / 2.8 / 3.0	Maximum (2.7, output voltage selected + 250 mV)
	VDD1 core (DCDC)	< 1		2.7
	VDD2 core (DCDC)	< 1		2.7
	SYSPOR (power ref)	< 1		2.7
	PBIAS (power ref)	< 1		2.7
VBAT pin name	VDD_VDAC_IN_6POV	370		
Internal module supplied	VDAC (LDO)	70	1.2 / 1.3 / 1.8	Maximum (2.7, output voltage selected + 250 mV)
	VINTANA1 (LDO)	50	1.5	Maximum (2.7, output voltage selected + 250 mV)
	VINTANA2 (LDO)	250	2.5 / 2.75	Maximum (2.7, output voltage selected + 250 mV)
	VIO core (DCDC)	< 1		2.7
VBAT pin name	VDD_VAUXI2S_IN_6POV	350		
Internal module supplied	VAUX2 (LDO)	100	1.3 / 1.5 / 1.6 / 1.7 / 1.8 / 1.9 / 2.0 / 2.1 / 2.2 / 2.3 / 2.4 / 2.5 / 2.8	Maximum (2.7, output voltage selected + 250 mV)
VBAT pin name	VDD_VMMC1_IN_6POV	220		
Internal module supplied	VMMC1 (LDO)	220	1.85 / 2.85 / 3.0 / 3.15	Maximum (2.7, output voltage selected + 250 mV)
	Power_REGBATT	0.001		2.7
VBAT pin name	VDD_VINT_IN_6POV	131		

Table 3-2. VBAT Minimum Required Per VBAT Ball and Associated Maximum Current (continued)

Category	Pin and Module	Maximum Current Specified (mA)	Output Voltage (V)	VBAT Minimum (V)
Internal module supplied	VINTDIG (LDO)	80	1.0 / 1.2 / 1.3 / 1.5	Maximum (2.7, output voltage selected + 250 mV)
	VRRTC (LDO)	30	1.5	Maximum (2.7, output voltage selected + 250 mV)
	VBACKUP (LDO)	1	2.5 / 3.0 / 3.1 / 3.2	Maximum (2.7, output voltage selected + 250 mV)

3.3 Recommended Operating Conditions

Table 3-3 lists the recommended operating maximum ratings.

Table 3-3. Recommended Operating Maximum Ratings

Parameter	Test Conditions	Min	Typ	Max	Unit
Main battery supply voltage		2.7 ⁽¹⁾	3.6	4.5	V
Backup battery supply voltage		1.8	3.2	3.3	V
Ambient temperature range		-40		85	°C

(1) 2.7 V is the minimum threshold for the battery at which the device will turn OFF. However, the minimum voltage at which the device will power ON is 3.2 V ±100 mV (if PWRON does not have a switch and is connected to VBAT) considering battery plug as the device switch on event. If PWRON has a switch then 3.2 V is the minimum for the device to turn ON.

3.4 Digital I/O Electrical Characteristics

Table 3-4 describes the digital I/O electrical characteristics. The following list defines abbreviations used in the table:

- RL: Reference level voltage applied to the I/O cell
- VOL: Low-level output voltage
- VOH: High-level output voltage
- VIL: Low-level input voltage
- VIH: High-level input voltage
- Min: Minimum value
- Max: Maximum value

Table 3-4. Digital I/O Electrical Characteristics

Pin Name	VOL (V)		VOH (V)		VIL (V)		VIH (V)		Max Freq (MHz)	Load (pF) Output Mode	Rise Time (ns)	Fall Time (ns)

4 Power Module

This section describes the electrical characteristics of the voltage regulators and timing characteristics of the supplies digitally controlled in the TPS65920 and TPS65930 devices .

Figure 4-1 is the power provider block diagram.

037-010

Two internal regulators, VRRRTC and VBRTC, are not shown. VRRRTC provides power to the RTC, and VBRTC is not used in this configuration.

Figure 4-1. Power Provider Block Diagram

NOTE

For the component values, see [Table 14-1](#).

4.1 Power Providers

Table 4-1 summarizes the power providers.

Table 4-1. Summary of the Power Providers

Name	Usage	Type	Voltage Range (V)	Default Voltage	Maximum Current
VAUX2	External	LDO	1.3, 1.5, 1.7, 1.8, 1.9, 2.0, 2.1, 2.2, 2.3, 2.4, 2.5, 2.8	1.8 V	100 mA
VMMC1	External	LDO	1.85, 2.85, 3.0, 3.15	3.0 V	220 mA
VPLL1	External	LDO	1.0, 1.2, 1.3, 1.8, 2.8, 3.0	1.8 V	40 mA
VDAC	External	LDO	1.2, 1.3, 1.8	1.8 V	70 mA
VIO	External	SMPS	1.8, 1.85	1.8 V	700 mA
VDD1	External	SMPS	0.6 ... 1.45	1.2 V	1200 mA
VDD2	External	SMPS	0.6 ... 1.5	1.2 V	600 mA
VINTANA1	Internal	LDO	1.5	1.5 V	50 mA
VINTANA2	Internal	LDO	2.5, 2.75	2.75 V	250 mA
VINTDIG	Internal	LDO	1.0, 1.2, 1.3, 1.5	1.5 V	80 mA
USBCP	Internal	Charge pump	5	5 V	100 mA
VUSB1V5	Internal	LDO	1.5	1.5 V	30 mA
VUSB1V8	Internal	LDO	1.8	1.8 V	30 mA
VUSB3V1	Internal	LDO	3.1	3.1 V	15 mA
VRRTC	Internal	LDO	1.5	1.5 V	30 mA
VBRTC	Internal	LDO	1.3	1.3 V	100 μ A

4.1.1 VDD1 dc-dc Regulator

4.1.1.1 VDD1 dc-dc Regulator Characteristics

The VDD1 dc-dc regulator is a stepdown dc-dc converter with a configurable output voltage. The programming of the output voltage and the characteristics of the dc-dc converter are SmartReflex-compatible. The regulator can be put in sleep mode to reduce its leakage (PFM) or in power-down mode when it is not in use. [Table 4-2](#) describes the regulator characteristics.

Table 4-2. VDD1 dc-dc Regulator Characteristics

Parameter	Comments	Min	Typ	Max	Unit
Input voltage range		2.7	3.6	4.5	V
Output voltage		0.6		1.45	V
Output voltage step	Covering the 0.6-V to 1.45-V range		12.5		mV
Output accuracy ⁽¹⁾	0.6 V to < 0.8 V	-6%		6%	
	0.8 V to 1.45 V	-4%		4%	
Switching frequency			3.2		MHz
Conversion efficiency ⁽²⁾ , Figure 4-2 in active mode	I _O = 10 mA, sleep		82%		
	100 mA < I _O < 400 mA		85%		
	400 mA < I _O < 600 mA		80%		
	600 mA < I _O < 800 mA		75%		
Output current	Active mode			1.2	A
	Sleep mode			10	mA
Ground current (I _Q)	Off at 30°C			3	μA
	Sleep, unloaded		30	50	
	Active, unloaded, not switching			300	
Short-circuit current	V _{IN} = V _{Max}		2.2		A
Load regulation	0 < I _O < I _{Max}			20	mV
Transient load regulation ⁽³⁾	I _O = 10 mA to (I _{Max} /2) + 10 mA, Maximum slew rate is I _{Max} /2/100 ns	-65		50	mV
Line regulation				10	mV
Transient line regulation	300 mV _{PP} ac input, 10-μs rise and fall time			10	mV
Start-up time			0.25	1	ms
Recovery time	From sleep mode to on mode with constant load		<10	100	μs
Slew rate (rising or falling) ⁽⁴⁾		4	8	16	mV/μs
Output shunt resistor (pulldown)			500	700	Ω
External coil	Value	0.7	1	1.3	μH
	Data capture record (DCR)			0.1	Ω
	Saturation current	1.8			A
External capacitor ⁽⁵⁾	Value	8	10	12	μF
	Equivalent series resistance (ESR) at switching frequency	0		20	mΩ

(1) Accuracy includes all variations (line and load regulations, line and load transients, temperature, and process)

(2) VBAT = 3.8 V, VDD1 = 1.3 V, Fs = 3.2 MHz, L = 1 μH, L_{DCR} = 100 mΩ, C = 10 μF, ESR = 10 mΩ

(3) Output voltage must discharge the load current completely and settle to its final value within 100 μs.

(4) Load current varies proportionally with the output voltage. The slew rate is for increasing and decreasing voltages, and the maximum load current is 1.1 A.

(5) Under current load condition step:
 I_{max}/2 (550 mA) in 100 ns with a ±20% external capacitor accuracy or
 I_{max}/3 (367 mA) in 100 ns with a ±50% external capacitor accuracy

See [Table 2-2](#) for how to connect the VDD1/2 dc-dc converter when it is not in use.

[Figure 4-2](#) shows the efficiency of the VDD1 dc-dc regulator in active mode and sleep mode.

Figure 4-2. VDD1 dc-dc Regulator Efficiency

4.1.1.2 External Components and Application Schematics

[Figure 4-3](#) is an application schematic with the external components on the VDD1 dc-dc regulator.

030-009

Figure 4-3. VDD1 dc-dc Application Schematic

NOTE

For the component values, see [Table 14-1](#).

4.1.2 VDD2 dc-dc Regulator

4.1.2.1 VDD2 dc-dc Regulator Characteristics

The VDD2 dc-dc regulator is a programmable output stepdown dc-dc converter with an internal field effect transistor (FET). Like the VDD1 regulator, the VDD2 regulator can be placed in sleep or power-down mode and is SmartReflex-compatible. The VDD2 regulator differs from VDD1 in its current load capability. [Table 4-3](#) describes the regulator characteristics.

Table 4-3. VDD2 dc-dc Regulator Characteristics

Parameter	Comments	Min	Typ	Max	Unit
Input voltage range		2.7	3.6	4.5	V
Output voltage		0.6	1	1.5	V
Output voltage step	Covering the 0.6-V to 1.45-V range, 1.5 V is a single programmable value		12.5		mV
Output accuracy ⁽¹⁾	0.6 V to < 0.8 V	–6%		6%	
	0.8 V to 1.5 V	–4%		4%	
Switching frequency			3.2		MHz
Conversion efficiency ⁽²⁾ , Figure 4-4 in active mode	$I_O = 10$ mA, sleep		82%		
	100 mA < I_O < 300 mA		85%		
	300 mA < I_O < 500 mA		80%		
Output current	Active mode			600	mA
	Sleep mode			10	mA
Ground current (I_Q)	Off at 30°C			1	μA
	Sleep, unloaded			50	
	Active, unloaded, not switching			300	
Short-circuit current	$V_{IN} = V_{Max}$		1.2		A
Load regulation	$0 < I_O < I_{Max}$			20	mV
Transient load regulation ⁽³⁾	$I_O = 10$ mA to $(I_{Max}/2) + 10$ mA, Maximum slew rate is $I_{Max}/2/100$ ns	–65		50	mV
Line regulation				10	mV
Transient line regulation	300 mV _{PP} ac input, 10-μs rise and fall time			10	mV
Output shunt resistor (internal pulldown)			500	700	Ω
Start-up time			0.25	1	ms
Recovery time	From sleep mode to on mode with constant load		25	100	μs
Slew rate (rising or falling) ⁽⁴⁾		4	8	16	mV/μs
External coil	Value	0.7	1	1.3	μH
	DCR			0.1	Ω
	Saturation current	900			mA
External capacitor ⁽⁵⁾	Value	8	10	12	μF
	ESR at switching frequency	0		20	mΩ

(1) Accuracy includes all variations (line and load regulations, line and load transients, temperature, and process)

(2) VBAT = 3.8 V, VDD2 = 1.3 V, Fs = 3.2 MHz, L = 1 μH, L_{DCR} = 100 mΩ, C = 10 μF, ESR = 10 mΩ

(3) Output voltage needs to discharge the load current completely and settle to its final value within 100 μs.

(4) Load current varies proportionally with the output voltage. The slew rate is for both increasing and decreasing voltages and the maximum load current is 600 mA.

(5) Under current load condition step:
 $I_{max}/2$ (300 mA) in 100 ns with a ±20% external capacitor accuracy or
 $I_{max}/3$ (200 mA) in 100 ns with a ±50% external capacitor accuracy

See [Table 2-2](#) for how to connect the VDD1/2 dc-dc converter when it is not in use.

[Figure 4-4](#) shows the efficiency of the VDD2 dc-dc regulator in active mode and sleep mode.

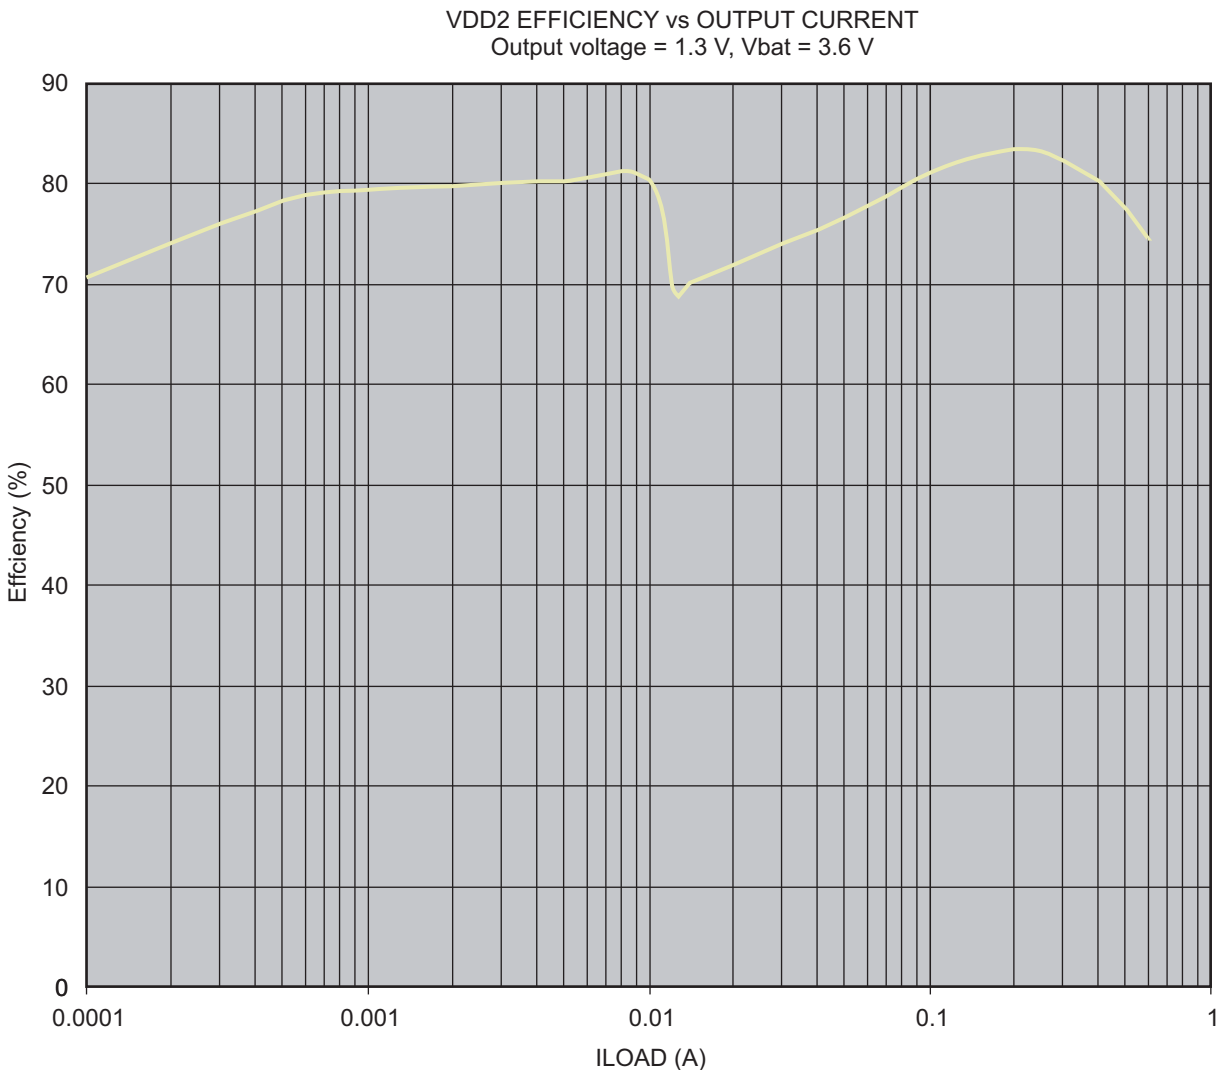

Figure 4-4. VDD2 dc-dc Regulator Efficiency

4.1.2.2 External Components and Application Schematics

[Figure 4-5](#) is an application schematic with the external components on the VDD2 dc-dc regulator.

030-010

NOTE

For the component values, see [Table 14-1](#).

4.1.3 VIO dc-dc Regulator

4.1.3.1 VIO dc-dc Regulator Characteristics

The I/O and memory dc-dc regulator is a 600-mA stepdown dc-dc converter (internal FET) with two output voltage settings. It supplies the memories and all I/O ports in the application and is one of the first power providers to switch on in the power-up sequence. This dc-dc regulator can be placed in sleep or power-down mode; however, care must be taken in the sequencing of this power provider, because numerous ESD blocks are connected to this supply. [Table 4-4](#) describes the regulator characteristics.

Table 4-4. VIO dc-dc Regulator Characteristics

Parameter	Comments	Min	Typ	Max	Unit
Input voltage range		2.7	3.6	4.5	V
Output voltage ⁽¹⁾			1.8 1.85		V
Output accuracy ⁽²⁾		-4%		4%	
		-3%		3%	
Switching frequency			3.2		MHz
Conversion efficiency ⁽³⁾ Figure 4-6 in active mode	$I_O = 10$ mA, sleep		85%		
	100 mA < I_O < 400 mA		85%		
	400 mA < I_O < 600 mA		80%		
Output current	On mode			700	mA
	Sleep mode			10	
Ground current (I_Q)	Off at 30°C			1	μA
	Sleep, unloaded			50	
	Active, unloaded, not switching			300	
Load transient ⁽⁴⁾				50	mV
Line transient	300 mV _{PP} ac, input rise and fall time 10 μs			10	mV
Start-up time			0.25	1	ms
Recovery time	From sleep mode to on mode with constant load		<10	100	μs
Output shunt resistor (internal pulldown)			500	700	Ω
External coil	Value	0.7	1	1.3	μH
	DCR			0.1	Ω
	Saturation current	900			mA
External capacitor	Value	8	10	12	μF
	ESR at switching frequency	1		20	mΩ

(1) This voltage is tuned according to the platform and transient requirements.

(2) ±4% accuracy includes all the variation (line and load regulation, line and load transient, temperature, process)
±3% accuracy is dc accuracy only.

(3) VBAT = 3.8 V, VIO = 1.8 V, Fs = 3.2 MHz, L = 1 μH, L_{DCR} = 100 mΩ, C = 10 μF, ESR = 10 mΩ

(4) Load transient can also be specified as $0 < I_O < I_{OUTmax}/2$, Δt = 1 μs, 100 mV but this is not included in ±4% accuracy.

Figure 4-6 shows the efficiency of the VIO dc-dc regulator in active mode and sleep mode.

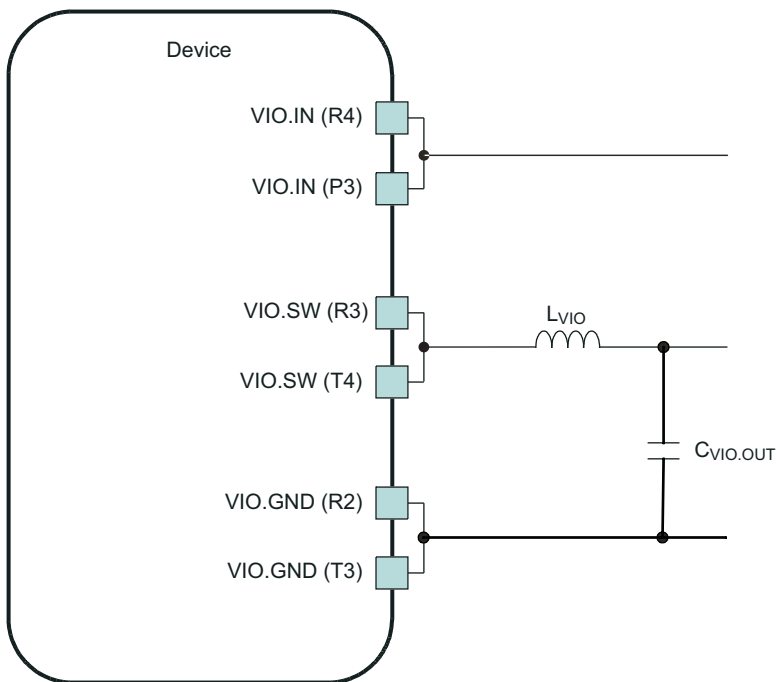

Figure 4-6. VIO dc-dc Regulator Efficiency

4.1.3.2 External Components and Application Schematics

Figure 4-7 is an application schematic with the external components on the VIO dc-dc regulator.

030-011

Figure 4-7. VIO dc-dc Application Schematic

NOTE

For the component values, see [Table 14-1](#).

4.1.4 VDAC LDO Regulator

The VDAC programmable LDO regulator is a high-PSRR, low-noise linear regulator that powers the host processor dual-video DAC. It is controllable with registers through I²C and can be powered down. [Table 4-5](#) describes the regulator characteristics.

Table 4-5. VDAC LDO Regulator Characteristics

Parameter	Test Conditions	Min	Typ	Max	Unit	
Output Load Conditions						
Filtering capacitor	Connected from VDAC.OUT to analog ground	0.3	1	2.7	μF	
Filtering capacitor ESR		20		600	mΩ	
Electrical Characteristics

	Transient line regulation	V _{IN} drops 500 mV Slew: 40 mV/μs			10	mV

4.1.6 VMMC1 LDO Regulator

The VMMC1 LDO regulator is a programmable linear voltage converter that powers the multimedia card (MMC) slot. It includes a discharge resistor and overcurrent protection (short-circuit). This LDO regulator can also be turned off automatically when MMC card extraction is detected. The VMMC1 LDO can be powered through an independent supply other than the battery; for example, a charge pump. In this case, the input from the VMMC1 LDO can be higher than the battery voltage. Table 4-7 describes the regulator characteristics.

Table 4-7. VMMC1 LDO Regulator Characteristics

Parameter	Test Conditions	Min	Typ	Max	Unit
Output Load Conditions					
Filtering capacitor	Connected from VMMC1.OUT to analog ground	0.3	1	2.7	μF
Filtering capacitor ESR		20		600	mΩ
Electrical Characteristics					
V _{IN}	Input voltage	2.7	3.6	5.5	V
V _{OUT}	Output voltage	1.7945 2.7645 2.91 3.0555	1.85 2.85 3.0 3.15	1.9055 2.9355 3.09 3.2445	V

	Transient line regulation	V _{IN} drops 500 mV Slew: 40 mV/μs		10	mV

4.1.8 Output Load Conditions

Table 4-9 lists the regulators that power the device, and the output loads associated with them.

Table 4-9. Output Load Conditions

Regulator	Parameter	Test Conditions	Min	Typ	Max	Unit
VINTDIG LDO	Filtering capacitor	Connected from VINTDIG.OUT to analog ground	0.3	1	2.7	μF
	Filtering capacitor ESR		20		600	$\text{m}\Omega$
VINTANA1 LDO	Filtering capacitor	Connected from VINTANA1.OUT to analog ground	0.3	1	2.7	μF
	Filtering capacitor ESR		20		600	$\text{m}\Omega$
VINTANA2 LDO	Filtering capacitor	Connected from VINTANA2.OUT to analog ground	0.3	1	2.7	μF
	Filtering capacitor ESR		20		600	$\text{m}\Omega$
VRUSB_3V1 LDO	Filtering capacitor	Connected from VUSB.3P1 to GND	0.3	1	2.7	μF
	Filtering capacitor ESR		0	10	600	$\text{m}\Omega$
VRUSB_1V8 LDO	Filtering capacitor	Connected from VINTUSB1P8.OUT to GND	0.3	1	2.7	μF
	Filtering capacitor ESR		0	10	600	$\text{m}\Omega$
VRUSB_1V5 LDO	Filtering capacitor	Connected from VINTUSB1P5 to GND	0.3	1	2.7	μF
	Filtering capacitor ESR		0	10	600	$\text{m}\Omega$

4.1.9 Charge Pump

The charge pump generates a 4.8-V (nominal) power supply voltage from the battery to the VBUS pin. The input voltage range is 2.7 to 4.5 V for the battery voltage. The charge pump operating frequency is 1 MHz.

The charge pump tolerates 7 V on VBUS when it is in power-down mode. The charge pump integrates a short-circuit current limitation at 450 mA. [Table 4-10](#) lists the charge pump output load conditions.

Table 4-10. Charge Pump Output Load Conditions

Parameter	Test Conditions	Min	Typ	Max	Unit
Output Load Conditions					
Filtering capacitor	Connected from VBUS to VSSP	1.41	4.7	6.5	μF
Flying capacitor	Connected from CP to CN	1.32	2.2	3.08	μF
Filtering capacitor ESR				20	mΩ

4.1.10 USB LDO Short-Circuit Protection Scheme

The short-circuit current for the LDOs and dc-dcs in the TPS65920 and TPS65930 devices is approximately twice the maximum load current. When the output of the block is shorted to ground, the power dissipation can exceed the 1.2-W requirement if no action is taken. A short-circuit protection scheme is included in the TPS65920 and TPS65930 devices to ensure that if the output of an LDO or dc-dc is short-circuited, the power dissipation does not exceed the 1.2-W level.

The three USB LDOs, VRUSB3V1, VRUSB1V8, and VRUSB1V5, are included in this short-circuit protection scheme, which monitors the LDO output voltage at a frequency of 1 Hz and generates an interrupt (sc_it) when a short-circuit is detected.

The scheme compares the LDO output voltage to a reference voltage and detects a short-circuit if the LDO voltage drops below this reference value (0.5 or 0.75 V programmable). In the case of the VRUSB3V1 and VRUSB1V8 LDOs, the reference is compared with a divided down voltage (1.5 V typical).

If a short-circuit is detected on VRUSB3V1, the power subchip FSM switches this LDO to sleep mode.

If a short-circuit is detected on VRUSB1V8 or VRUSB1V5, the power subchip FSM switches off the relevant LDO.

4.2 Power References

The bandgap voltage reference is filtered (resistance/capacitance [RC] filter) using an external capacitor connected across the VREF output and an analog ground (REFGND). The VREF voltage is scaled, distributed, and buffered in the device. The bandgap is started in fast mode (not filtered), and is set automatically by the power state-machine in slow mode (filtered, less noisy) when required.

Table 4-11 lists the voltage reference characteristics.

Table 4-11. Voltage Reference Characteristics

Parameter	Test Conditions	Min	Typ	Max	Unit
Output Load Condition					
Filtering capacitor	Connected from V _{REF} to GNDREF	0.3	1	2.7	μF
Electrical Characteristics					
V _{IN} Input voltage	On mode	2.7	3.6	4.5	V
Internal bandgap reference voltage	On mode, measured through TESTV terminal	1.272	1.285	1.298	V
Reference voltage (V _{REF} terminal)	On mode	0.749	0.75	0.77	V
Retention mode reference	On mode	0.492	0.5	0.508	V
I _{REF} NMOS sink		0.9	1	1.1	μA
Ground current	Bandgap I _{REF} block Preregulator V _{REF} buffer Retention reference buffer			25 20 15 10 10	μA
Output spot noise	100 Hz			1	μV/√Hz
A-weighted noise (rms)			200		nV (rms)
P-weighted noise (rms)			150		nV (rms)
Integrated noise	20 to 100 kHz		2.2		μV
I _{BIAS} trim bit LSB				0.1	μA
Ripple rejection	<1 MHz from VBAT	60			dB
Start-up time				1	ms

4.3 Power Control

4.3.1 Backup Battery Charger

If the backup battery is rechargeable, it can be recharged from the main battery. A programmable voltage regulator powered by the main battery allows recharging of the backup battery. The backup battery charge must be enabled using a control bit register. Recharging starts when two conditions are met:

- Main battery voltage > backup battery voltage
- Main battery > 3.2 V

The comparators of the backup battery system (BBS) give the two thresholds of the backup battery charge startup. The programmed voltage for the charger gives the end-of-charge threshold. The programmed current for the charger gives the charge current.

Overcharging is prevented by measurement of the backup battery voltage through the GP ADC. Table 4-12 lists the characteristics of the backup battery charger.

Table 4-12. Backup Battery Charger Characteristics

Parameter	Test Conditions	Min	Typ	Max	Unit
VBACKUP-to-MADC input attenuation	VBACKUP from 1.8 to 3.3 V		0.33		V/V

Table 4-12. Backup Battery Charger Characteristics (continued)

Parameter	Test Conditions	Min	Typ	Max	Unit
Backup battery charging current	VBACKUP = 2.8 V, BBCHEN = 1, BBISEL = 00	10	25	45	μA
	VBACKUP = 2.8 V, BBCHEN = 1, BBISEL = 01	105	150	270	μA
	VBACKUP = 2.8 V, BBCHEN = 1, BBISEL = 10	350	500	900	μA
	VBACKUP = 2.8 V, BBCHEN = 1, BBISEL = 11	0.7	1	1.8	mA

	VBACKUP = 0 V, BBCHEN = 1, BBISEL = 10	350	500	900	μA
	VBACKUP = 0 V, BBCHEN = 1, BBISEL = 11	0.7	1	1.8	mA
End backup battery charging voltage: VBBCHGEN	I _{VBACKUP} = -10 μA, BBSEL = 00	2.4	2.5	2.6	V
	I _{VBACKUP} = -10 μA, BBSEL = 01	2.9	3.0	3.1	V
	I _{VBACKUP} = -10 μA, BBSEL = 10	3.0	3.1	3.2	V
	I _{VBACKUP} = -10 μA, BBSEL = 11	3.1	3.2	3.3	V

4.3.2 Battery Monitoring and Threshold Detection

4.3.2.1 Power On/Power Off and Backup Conditions

Table 4-13 lists the threshold levels of the battery.

Table 4-13. Battery Threshold Levels

Parameter	Test Conditions	Min	Typ	Max	Unit
Main battery charged threshold VMBCH	Measured on VBAT terminal	3.1	3.2	3.3	V
Main battery low threshold VMBLO	VBACKUP = 3.2 V, measured on VBAT terminal (monitored on terminal ONNOFF)	2.55	2.7	2.85	V
Main battery high threshold VMBHI	Measured on terminal VBAT, VBACKUP = 0 V	2.5	2.65	2.95	V
	Measured on terminal VBAT, VBACKUP = 3.2 V	2.5	2.85	2.95	V
Batteries not present threshold VBNPR	Measured on terminal VBACKUP with VBAT < 2.1 V	1.6	1.8	2.0	V
	Measured on terminal VBAT with VBACKUP = 0 V (monitored on terminal VRRTC)	1.95	2.1	2.25	V

4.3.3 VRRTC LDO Regulator

The VRRTC voltage regulator is a programmable, low dropout, linear voltage regulator supplying (1.5 V) the embedded real-time clock (32.768-kHz oscillator) and dedicated I/Os of the digital host counterpart. The VRRTC regulator is also the supply voltage of the power-management digital state-machine. The VRRTC regulator is supplied from the UPR line, switched on by the main or backup battery, depending on the system state. The VRRTC output is present as long as a valid energy source is present. The VRRTC line is supplied by an LDO when VBAT > 2.7, and a clamp circuit when in backup mode. Table 4-14 describes the regulator characteristics.

Table 4-14. VRRTC LDO Regulator Characteristics

Parameter	Test Conditions	Min	Typ	Max	Unit
Output Load Conditions					
Filtering capacitor	Connected from VRTC.OUT to analog ground	0.3	1	2.7	μF

		On mode, I _{OUT} = I _{OUTmax}			100	
		Sleep mode, I _{OUT} = 0			10	
		Sleep mode, I _{OUT} = 1 mA			11	
		Off mode			1	
V _{DO}	Dropout voltage ⁽¹⁾	On mode, I _{OUT} = I _{OUTmax}			250	mV
	Transient load regulation	I _{LOAD} : I _{MIN} – I _{MAX} Slew: 40 mA/µs	–40		40	mV
	Transient line regulation	V _{IN} drops 500 mV Slew: 40 mV/µs			10	mV
	Overshoot	Softstart			3%	
	Pull down resistance	Default in off mode	250	320	450	Ω

(1) For nominal output voltage

4.4 Power Consumption

Table 4-15 describes the power consumption depending on the use cases.

NOTE

Typical power consumption is obtained in the nominal operating conditions and with the TPS65920 and TPS65930 devices in stand-alone configuration.

Table 4-15. Power Consumption

Mode	Description		Typical Consumption
Backup	Only the RTC date is maintained with a couple of registers in the backup domain. No main source is connected. Consumption is on the backup battery.	V _{BAT} not present	2.25 * 3.2 = 7.2 µW
Wait on	The phone is apparently off for the user, a main battery is present and well-charged. The RTC registers and registers in the backup domain are maintained. The wake-up capabilities (such as the PWRON button) are available.	V _{BAT} = 3.8 V	64 * 3.8 = 243.2 µW
Active no load	The subsystem is powered by the main battery, all supplies are enabled with full current capability, internal reset is released, and the associated processor is running.	V _{BAT} = 3.8 V	3291 * 3.8 = 12505 µW
Sleep no load	The main battery powers the subsystem, selected supplies are enabled but in low-consumption mode, and the associated processor is in low-power mode.	V _{BAT} = 3.8 V	496 * 3.8 = 1884.4 µW

Table 4-16 lists the regulator states according to the mode in use.

Table 4-16. Regulator State Depending on Use Case

Regulator	Mode			
	Backup	Wait On	Sleep No Load	Active No Load
VAUX2	OFF	OFF	SLEEP	ON
VMMC1	OFF	OFF	OFF	OFF
VPLL1	OFF	OFF	SLEEP	ON
VDAC	OFF	OFF	OFF	OFF
VINTANA1	OFF	OFF	SLEEP	ON
VINTANA2	OFF	OFF	SLEEP	ON
VINTDIG	OFF	OFF	SLEEP	ON
VIO	OFF	OFF	SLEEP	ON
VDD1	OFF	OFF	SLEEP	ON
VDD2	OFF	OFF	SLEEP	ON
VUSB_1V5	OFF	OFF	OFF	OFF
VUSB_1V8	OFF	OFF	OFF	OFF
VUSB_3V1	OFF	OFF	SLEEP	SLEEP

4.5 Power Management

4.5.1 Boot Modes

Table 4-17 lists the modes corresponding to BOOT0–BOOT1.

Table 4-17. BOOT Mode Description

Name	Description	BOOT0	BOOT1
	Reserved	0	0
MC027	Master_C027_Generic 01	0	1
MC021	Master_C021_Generic 10	1	0
SC021	Slave_C021_Generic 11	1	1

4.5.2 Process Modes

This parameter defines:

- The boot voltage for the host core
- The boot sequence associated with the process
- The dynamic voltage and frequency scaling (DVFS) protocol associated with the process

4.5.2.1 MC021 Mode

Table 4-18 lists the characteristics of MC021 mode.

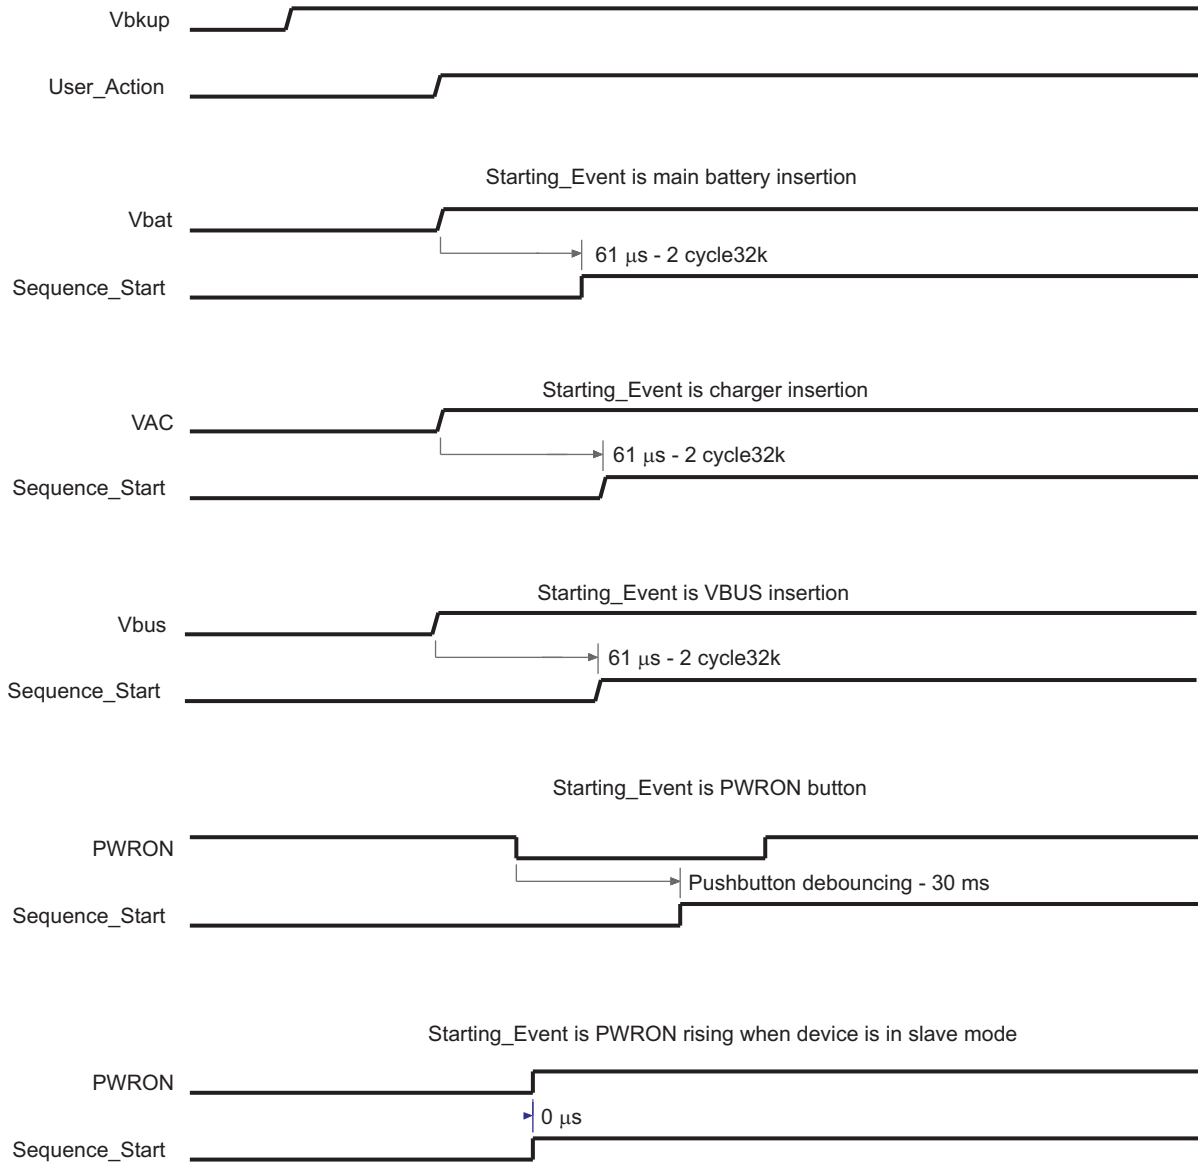

Table 4-18. MC021 Mode

Boot core voltage	1.2 V
Power sequence	VIO followed by VPLL1, VDD2, VDD1
DVFS protocol	SmartReflex IF (I ² C HS)

4.5.3 Power-On Sequence

4.5.3.1 Timing Before Sequence_Start

Sequence_Start is a symbolic internal signal to ease the description of the power sequences. It occurs according to the events shown in [Figure 4-8](#).

030-012

Figure 4-8. Timing Before Sequence Start

4.5.3.2 Power-On Sequence

Figure 4-9 describes the timing and control that must occur in the OMAP3 mode. Sequence_Start is a symbolic internal signal to ease the description of the power sequences. It occurs according to the events shown in Figure 4-8.

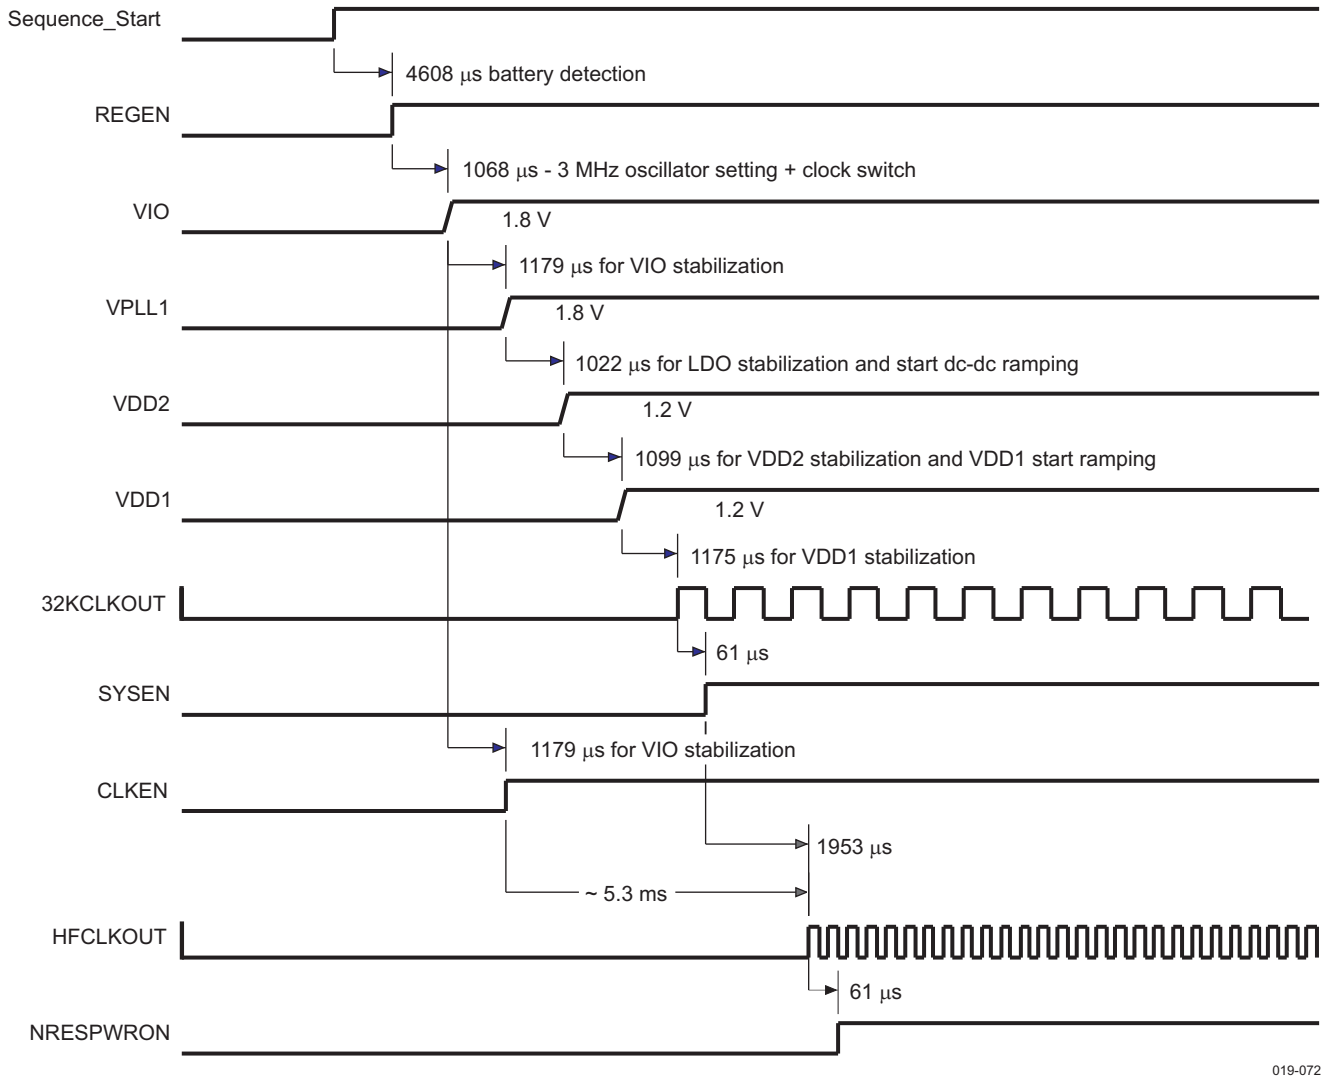

Figure 4-9. Timings—Power On in OMAP3 Mode

4.5.3.3 Power On in Slave_C021 Mode

Figure 4-10 describes the timing and control that must occur in the Slave_C021 mode. Sequence_Start is a symbolic internal signal to ease the description of the power sequences and occurs according to the different events detailed in Figure 4-8.

030-022

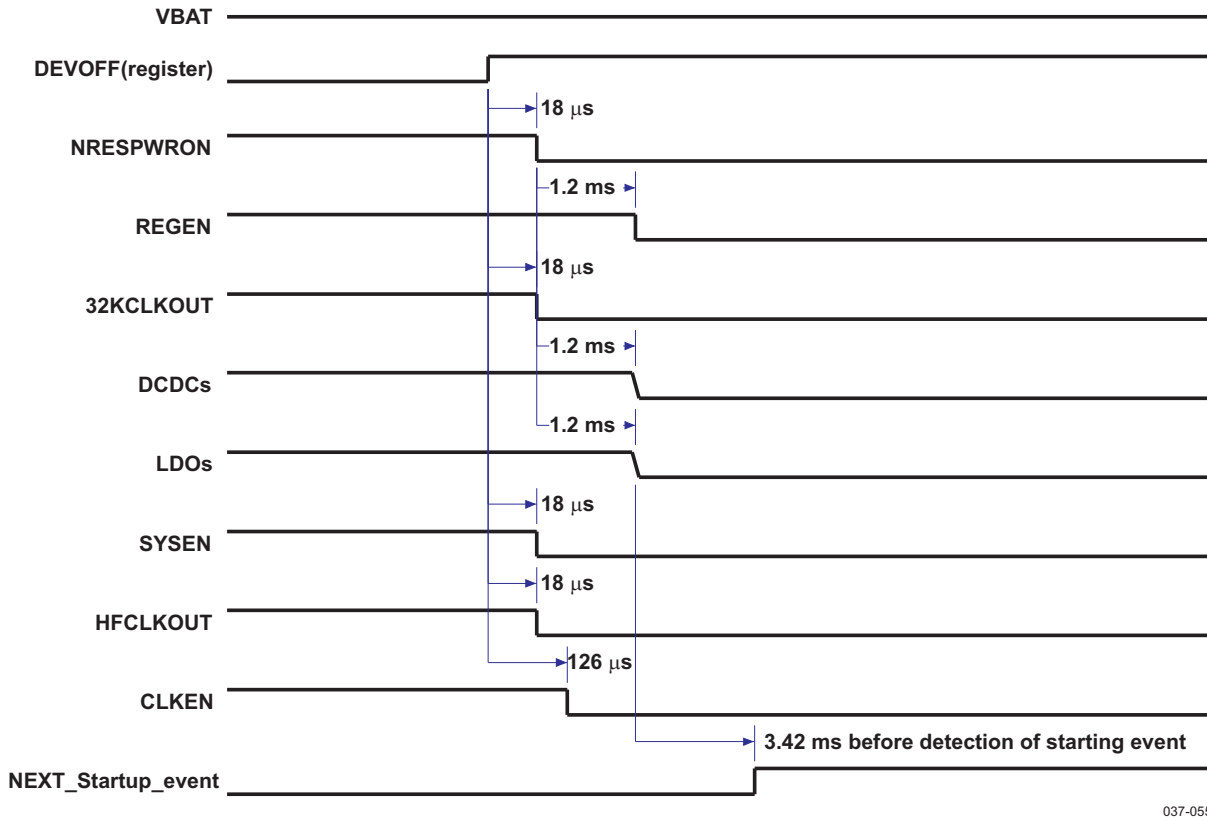

Figure 4-10. Timings—Power On in Slave_C021 Mode

4.5.4 Power-Off Sequence

This section describes the signal behavior required to power down the system.

4.5.4.1 Power-Off Sequence

Figure 4-11 shows the timing and control that occur during the power-off sequence in master modes.

NOTE: All of these timings are typical values with the default setup (depending on the resynchronization between power domains, state machinery priority, etc.).

Figure 4-11. Power-Off Sequence in Master Modes

Because of the internal frequency used by Power STM switching from 3 to 1.5 MHz when the HF clock value is 19.2 MHz, if the HF clock value is not 19.2 MHz (with HFCLK_FREQ bit field values set accordingly in the CFG_BOOT register), the delay between DEVOFF and NRESPWRON/CLK32KOUT/SYSEN/HFCLKOUT is divided by two (approximately 9 μs).

The DEVOFF event is PWRON falling edge in slave mode and DEVOFF internal register write in master mode.

5 Real-Time Clock and Embedded Power Controller

The TPS65930 and TPS65920 devices contain an RTC to provide clock and timekeeping functions and an EPC to provide battery supervision and control.

5.1 RTC

The RTC provides the following basic functions:

- Time information (seconds/minutes/hours) directly in binary-coded decimal (BCD) code
- Calendar information (day/month/year/day of the week) directly in BCD code
- Interrupt generation periodically (1 second/1 minute/1 hour/1 day) or at a precise time (alarm function)
- 32-kHz oscillator drift compensation and time correction
- Alarm-triggered system wake-up event

5.1.1 Backup Battery

The TPS65030 and TPS65920 devices device implement a backup mode in which a backup battery can keep the RTC running to maintain clock and time information even if the main supply is not present. If the backup battery is rechargeable, the device also provides a backup battery charger so it can be recharged when the main battery supply is present.

The backup domain powers the following:

- Internal 32.768-kHz crystal oscillator
- RTC
- Eight general-purpose (GP) storage registers
- Backup domain low-power regulator (VBRTC)

5.2 EPC

The EPC provides five system states for optimal power use by the system, as listed in [Table 5-1](#).

Table 5-1. System States

System State	Description
NO SUPPLY	The system is not powered by any battery.
BACKUP	The system is powered only with the backup battery and maintains only the VBRTC supply.
WAIT-ON	The system is powered by the main battery and maintains only the VVRTC supply. It can accept switch-on requests.
ACTIVE	The system is powered by the main battery; all supplies can be enabled with full current capability.
SLEEP	The main battery powers the system; selected supplies are enabled, but in low consumption mode.

Three categories of events can trigger state transitions:

- Hardware events: Supply/battery insertion, wake-up requests, USB plug, and RTC alarm
- Software events: Switch-off commands, switch-on commands, and sleep on commands
- Monitoring events: Supply/battery level check, main battery removal, main battery fail, and thermal shutdown

6 Audio/Voice Module (TPS65930 Device Only)

NOTE

This section applies only to the TPS65930 device.

Figure 6-1 is the audio/voice module block diagram.

Figure 6-1. Audio/Voice Module Block Diagram

6.1 Audio/Voice Downlink (RX) Module

The audio/voice module includes the following output stages:

- Predriver output signals for external class-D amplifiers (single-ended)
- Vibrator H-bridge

6.1.1 Predriver for External Class-D Amplifier

The external class-D amplifiers provide a stereo signal on terminals PreD.LEFT and PreD.RIGHT to drive the external class-D amplifier. These terminals are available if a stereo, single-ended, ac-coupled headset is used.

6.1.1.1 Predriver Output Characteristics

Table 6-1 lists the predriver output characteristics.

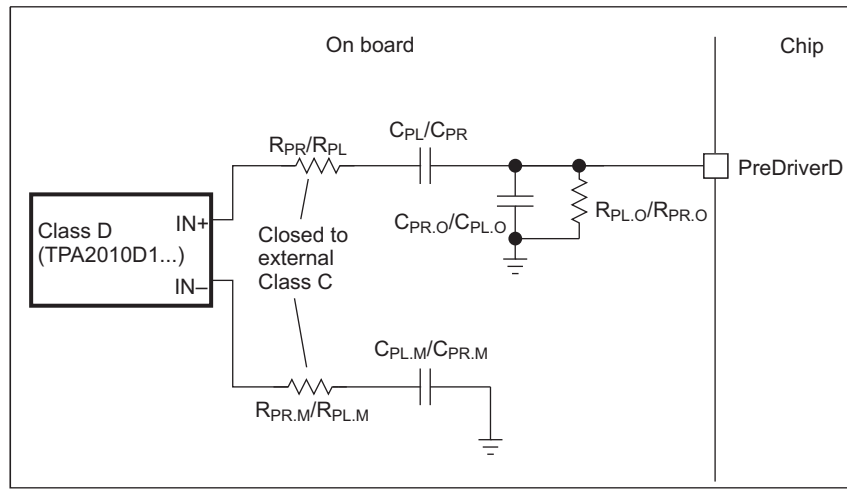

Table 6-1. Predriver Output Characteristics

Parameter	Test Conditions	Min	Typ	Max	Unit
Load impedance		10			kΩ
		50			pF
Gain range ⁽¹⁾	Audio path	-92		30	dB
	Voice path	-66		30	
Absolute gain error		-1		1	dB
Peak-to-peak output voltage (0 dBFs)	Default gain ⁽²⁾		1.5		V _{PP}
Total harmonic distortion Default gain ⁽²⁾ Load > 10 kΩ // 50 pF	At 0 dBFs		-80	-75	dB
	At -6 dBFs		-74	-69	
	At -20 dBFs		-70	-65	
	At -60 dBFs		-30	-25	
Idle channel noise (20 Hz to 20 kHz, A-weighted)	Default gain ⁽²⁾ Load = 10 Ω		-90	-85	dB
SNR (A-weighted over 20-kHz bandwidth) Default gain ⁽²⁾	At 0 dBFs	83	88		dB
	At -60 dBFs		30		
Output PSRR (for all gains)	20 Hz to 4 kHz		90		dB
	20 Hz to 20 kHz		70		

- (1) Audio digital filter = -62 to 0 dB (1-dB steps) and 0 to 12 dB (6-dB steps)
 Voice digital filter = -3 to 12 dB (1-dB steps)
 ARXPGA (volume control) = -24 to 12 dB (2-dB steps)
 Output driver = -6 dB, 0 dB, 6 dB
- (2) The default gain setting assumes the ARXPGA has 0-dB gain setting (volume control) and output driver at 0-dB gain setting.

6.1.1.2 External Components and Application Schematics

Figure 6-2 is a simplified schematic for the external class-D predriver.

037-054

Input resistor (R_{PR} or R_{PL}) sets the gain of the external class D. For TPS2010D1, the gain is defined according to the following equation:
 Gain (V/V) = 2*150*10³/(R_{PR} or R_{PL})
 R_{PR} or R_{PL} > 15 kΩ

Figure 6-2. Predriver for External Class D

NOTE

For other component values, see [Table 14-1](#).

6.1.2 Vibrator H-Bridge

A digital signal from the pulse width modulated generator is fed to the vibrator H-bridge driver. The vibrator H-bridge is a differential driver that drives vibrator motors. The differential output allows dual rotation directions.

6.1.2.1 Vibrator H-Bridge Output Characteristics

Table 6-2 lists the vibrator H-bridge output characteristics.

Table 6-2. Vibrator H-Bridge Output Characteristics

Parameter	Test Conditions	Min	Typ	Max	Unit
VBAT voltage		2.8	3.6	4.8	V
Differential output swing (16-Ω load)	VBAT = 2.8 V	3.6			V _{PP}
	VBAT = 3.5 V	4.3			
Output resistance (summed for both sides)				8	Ω
Load capacitance				100	pF
Load resistance		8	16	60	Ω
Load inductance			30	300	μH
Total harmonic distortion				10%	
Operating frequency		20		10k	Hz

6.1.2.2 External Components and Application Schematics

Figure 6-3 is a simplified vibrator H-bridge schematic.

Figure 6-3. Vibrator H-Bridge

NOTE

For other component values, see Table 14-1.

Example of ferrite: BLM 18BD221SN1.

6.1.3 Carkit Output

The USB-CEA carkit uses the DP/DM pad to output audio signals (see the *CEA-936–Mini-USB Analog Carkit* specification).

Figure 6-4 shows the carkit output downlink full path characteristics for audio and USB.

037-052

Figure 6-4. Carkit Output Downlink Path Characteristics

Table 6-3 lists the USB-CEA carkit audio downlink electrical characteristics.

Table 6-3. USB-CEA Carkit Audio Downlink Electrical Characteristics

Parameter	Conditions	Min	Typ	Max	Unit
Output load	USB-CEA (DP/DM)	20			kΩ
Gain range ⁽¹⁾	Audio path	-92		30	dB
	Voice path	-66		30	
Absolute gain error	At 1 kHz	-1		1	dB
Peak-to-peak differential output voltage (0 dBFS)	Gain = 0 dB		1.5		V _{PP}
Total harmonic distortion	At 0 dBFS		-80	-75	dB
	At -6 dBFS		-74	-69	
	At -20 dBFS		-70	-65	
	At -60 dBFS		-30	-25	
THD+N (20 Hz to 20 kHz, A-weighted)	At 0 dBFS		60		dB
Idle channel noise (20 Hz to 20 kHz, A-weighted)	Default gain ⁽²⁾		-90	-85	dB
Output PSRR	20 Hz to 20 kHz		60		dB
Supply voltage (Vintana1)			1.5		V
Common mode output voltage for USB-CEA		1.3	1.35	1.4	V
Isolation between D+/D- during audio mode (20 Hz to 20 kHz)		60			dB
Crosstalk between right and left channels	USB-CEA stereo		-90		dB
Crosstalk RX/Tx (1 V _{PP} output)	USB-CEA mono/stereo			-60	dB
Signal noise ratio (20 Hz to 20 kHz, A-weighted)	At 0 dBFS		60		dB
Phone speaker amplifier output impedance at 1 kHz	USB-CEA (DP/DM)			200	Ω

(1) Audio digital filter = -62 to 0 dB (1-dB steps) and 0 to 12 dB (6-dB steps)
 Voice digital filter = -36 to 12 dB (1-dB steps)
 ARXPGA (volume control) = -24 to 12 dB (2-dB steps)
 Output driver (USB-CEA) = -1 dB

(2) The default gain setting assumes the ARXPGA has 0-dB gain setting (volume control) and output driver at 0.6-dB gain setting.

6.1.4 Digital Audio Filter Module

Figure 6-5 shows the digital audio filter downlink full path characteristics for the audio interface.

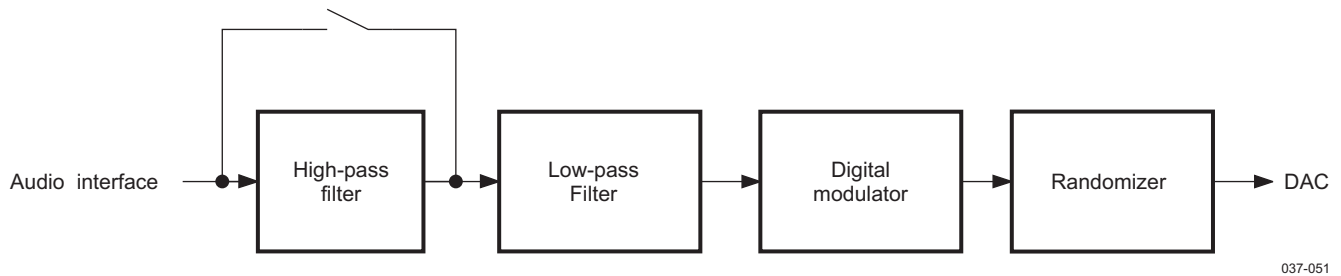

Figure 6-5. Digital Audio Filter Downlink Path Characteristics

The HPF can be bypassed. It is controlled by the MISC_SET_2 ARX_HPFBYP bit set to address 0x49.

Table 6-4 lists the audio filter frequency responses relative to reference gain at 1 kHz.

Table 6-4. Digital Audio Filter RX Electrical Characteristics

Parameter	Conditions	Min	Typ	Max	Unit
Passband			0.42		F _S
Passband ripple	0 to 0.42F _S ⁽¹⁾	-0.25	0.1	0.25	dB
Stopband			0.6		F _S
Stopband attenuation	F = 0.6F _S ⁽¹⁾ to 0.8F _S ⁽¹⁾	60	75		dB
Group delay			15.8/F _S ⁽¹⁾		μs
Linear phase		-1.4		1.4	°

(1) F_S is the sampling frequency (8, 11.025, 12, 16, 22.05, 24, 32, 44.1, or 48 kHz).

6.1.5 Boost Stage

The boost effect adds emphasis to low frequencies. It compensates for a HPF created by the capacitor resistor (CR) filter of the headset (in ac-coupling configuration).

There are four modes. Three effects are available, with slightly different frequency responses, and the fourth setting disables the boost effect:

- Boost effect 1
- Boost effect 2
- Boost effect 3
- Flat equalization: The boost effect is in bypass mode.

NOTE

Boost effect modes are defined in Table 6-5.

Table 6-5 and Table 6-6 include the typical values according to the frequency response versus input frequency and F_S frequency.

Table 6-5. Boost Electrical Characteristics Versus F_S Frequency ($F_S \leq 22.05$ kHz)

Frequency (Hz)	$F_S = 8$ kHz			$F_S = 11.025$ kHz			$F_S = 12$ kHz			$F_S = 16$ kHz			$F_S = 22.05$ kHz			Unit
	1	2	3	1	2	3	1	2	3	1	2	3	1	2	3

6.2 Audio Uplink (TX) Module

The audio uplink path includes two input amplification stages:

- MIC_MAIN_P, MIC_MAIN_M (differential main handset input)
- AUXR (common terminal: single-ended auxiliary)

NOTE

If two audio inputs are needed, and mic bias is not needed, the AUXR input can be used with MIC_MAIN to provide the two inputs.

6.2.1 Microphone Bias Module

A bias generator provides an external voltage of 2.2 V to bias the analog microphones (MICBIAS1 terminal). The typical output current is 1 mA.

6.2.1.1 Analog Microphone Bias Module Characteristics

Table 6-7 lists the characteristics of the analog microphone bias module.

Table 6-7. Analog Microphone Bias Module Characteristics With Bias Resistor

Parameter	Test Conditions	Min	Typ	Max	Unit
Bias voltage		2.15	2.2	2.25	V
Load current				1	mA
Output noise	P-weighted 20 Hz to 6.6 kHz			1.8	μV_{RMS}
External capacitor		0		200	pF
Internal resistance		50	60	70	k Ω

NOTE

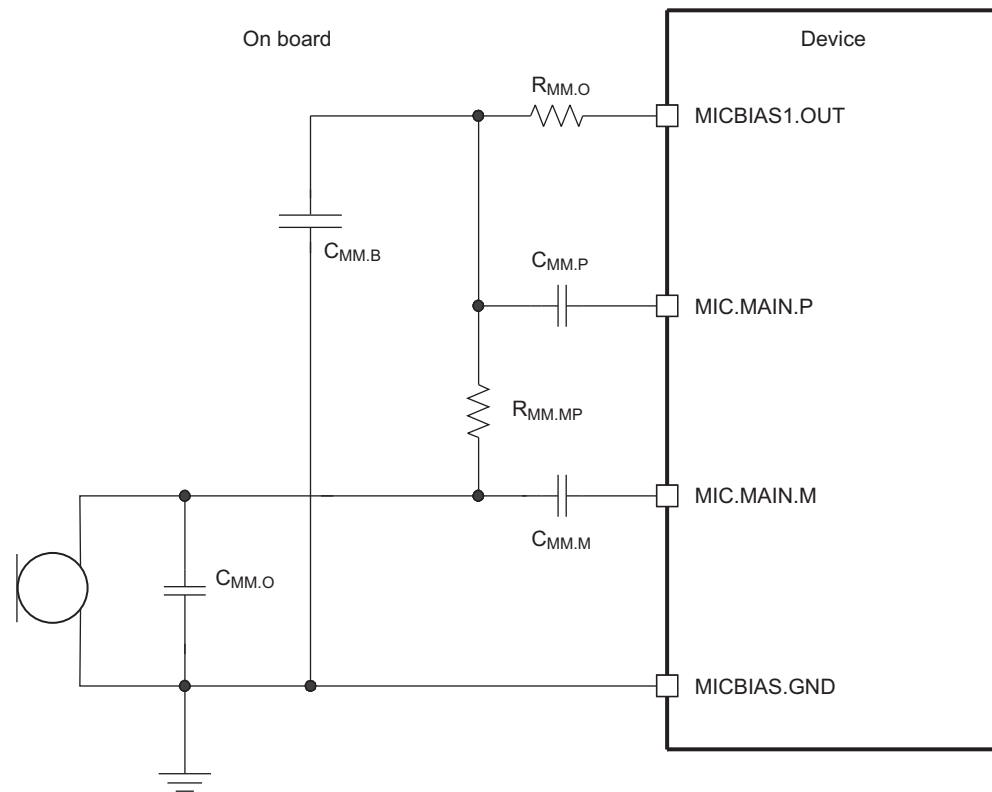

If the external capacitor is higher than 200 pF, the analog microphone bias becomes unstable. To stabilize it, add a serial resistor.

Table 6-8 lists the characteristics of the analog microphone bias module with a bias resistor.

Table 6-8. Analog Microphone Bias Module Characteristics With Bias Resistor

Parameter	Test Conditions	Min	Typ	Max	Unit
R_{SB}	$C_{\text{B}} < 200 \text{ pF}$	0			Ω
	$C_{\text{B}} = 100 \text{ pF}$	300			
	$C_{\text{B}} = 1 \text{ }\mu\text{F}$	500			
$R_{\text{B}} + R_{\text{SB}}$			2.2 to 2.7		k Ω

Figure 6-6 and Figure 6-7 show the external components and application schematics for the analog microphone.

037-005

Figure 6-6. Analog Microphone Pseudodifferential

NOTE

For other component values, see [Table 14-1](#).

037-006

Figure 6-7. Analog Microphone Differential

NOTE

For other component values, see [Table 14-1](#).

NOTE

To improve the rejection, ensure that MICBIAS_GND is as clean as possible. This ground must be shared with AGND of the TPS65920 or TPS65930 device and must not share with AVSS4, which is the ground used by RX class AB output stages.

In differential mode, adding a low-pass filter (made by R_{SB} and C_B) is highly recommended if coupling between RX output stages and the microphone is too high (and not enough attenuation by the echo cancellation algorithm). The coupling can come from:

- The internal TPS65920/TPS65930 coupling between MICBIAS.OUT voltage and RX output stages
- Coupling noise between MICBIAS.GND and AVSS4

In pseudodifferential mode, the dynamic resistance of the microphone improves the rejection versus MICBIAS.OUT:

$$PSRR = 20 \cdot \log((R_B + R_{D_{yn_mic}})/R_B).$$

6.2.1.2 Silicon Microphone Module Characteristics

Based on silicon micro-electrical-mechanical system (MEMS) technology, the new microphone achieves the same acoustic and electrical properties as conventional microphones, but is more rugged and exhibits higher heat resistance. These properties offer designers of a wide range of products greater flexibility and new opportunities to integrate microphones.

The silicon microphone is the integration of mechanical elements and electronics on a common silicon substrate through microfabrication technology.

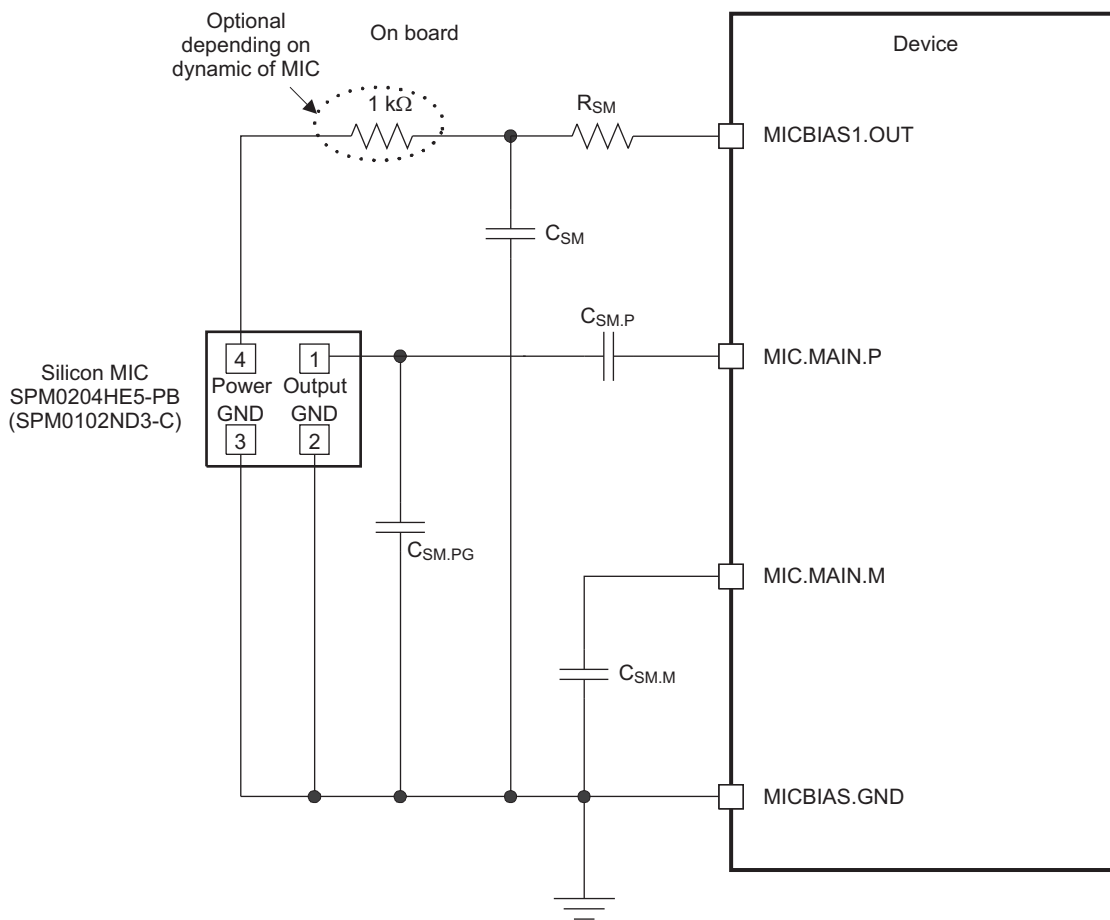

The complementary metal oxide semiconductor (CMOS) MEMS microphone is more like an analog IC than a classical microphone, or electric condenser microphone (ECM). It is powered as an IC with a direct connection to the power supply. The on-chip isolation between the power input and the rest of the system adds power supply rejection (PSR) to the component. This makes the CMOS MEMS microphone inherently more immune to power supply noise than an ECM and eliminates the need for additional filtering circuitry to keep the power supply line clean.

Table 6-9 lists the characteristics of the silicon microphone module.

Table 6-9. Silicon Microphone Module Characteristics

Parameter	Test Conditions	Min	Typ	Max	Unit
Bias voltage			2.2		V
Load current				1	mA
Output noise	P-weighted 20 Hz to 6.6 kHz			1.8	μV_{RMS}

Figure 6-8 is a schematic for the silicon microphone.

037-007

Figure 6-8. Silicon Microphone

NOTE

For other component values, see Table 14-1.

6.2.2 FM Radio/Auxiliary Input

The auxiliary input AUXR/FMR can be used as FM radio input. The amplification stage output is connected to the ADC input. The FM radio input can also be output through an audio output stage.

6.2.2.1 External Components

Figure 6-9 shows the external components on the auxiliary input.

Figure 6-9. Audio Auxiliary Input

NOTE

For other component values, see Table 14-1.

6.2.3 Uplink Characteristics

Figure 6-10 shows the uplink amplifier. Table 6-10 lists the uplink characteristics.

Figure 6-10. Uplink Amplifier

Table 6-10. Uplink Characteristics

Parameter	Test Conditions	Min	Typ	Max	Unit
Speech delay	Voice path		0.5		ms
Gain range ⁽¹⁾		0		61	dB
Absolute gain	0 dBFs at 1.02 kHz	-1		1	dB
Peak-to-peak differential input voltage (0 dBFs)	For differential input 0 dB gain setting			1.5	V _{PP}
Peak-to-peak single-ended input voltage (0 dBFs)	For single-ended input 0 dB gain setting			1.5	V _{PP}

(1) Gain range is defined by: Preamplifier = 0 to 30 dB; Filter = 0 to 31 dB (1-dB steps)

Table 6-10. Uplink Characteristics (continued)

Parameter	Test Conditions	Min	Typ	Max	Unit
Input impedance ⁽²⁾		40k		70k	Ω
Total harmonic distortion (sine wave at 1.02 kHz)	At -1 dBFs		-80	-75	dB
	At -6 dBFs		-74	-69	
	At -10 dBFs		-70	-65	
	At -20 dBFs		-60	-55	
	At -60 dBFs		-20	-15	
Idle channel noise	20 Hz to 20 kHz, A-weighted, gain = 0 dB		-85	-78	dBFs
	16 kHz: < 20 Hz to 7 kHz, gain = 0 dB		-90		
	8 kHz: P-weighted voice, gain = 18 dB		-87		
	16 kHz: < 20 Hz to 7 kHz, gain = 18 dB		-82		
Crosstalk A/D to D/A	Gain = 0 dB		-80		dB
Crosstalk path between two microphones		-70			dB
Intermodulation distortion	2-tone method			-60	dB

(2) Impedance varies in the specified range with gain selection.

6.2.4 Microphone Amplification Stage

The microphone amplification stages perform the single-to-differential conversion for single-ended inputs. Two programmable gains from 0 dB to 30 dB can be set:

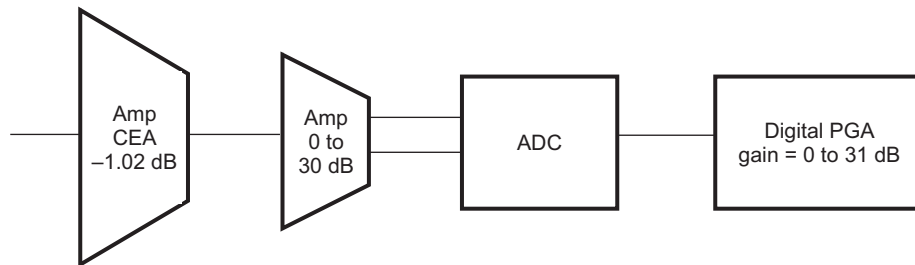

- Automatic level control for main microphone input. The gain step is 1 dB.
- Level control by register for line-in or carkit input. The gain step is 6 dB.

The amplification stage outputs are connected to the ADC input (ADC left and right).

6.2.5 Carkit Input

The USB-CEA carkit uses the DP pad to input the audio signal.

Figure 6-11 shows the uplink carkit full path uplink characteristics for audio and USB.

037-009

Figure 6-11. Carkit Input Uplink Path Characteristics

Table 6-11 lists the USB-CEA carkit audio electrical characteristics.

Table 6-11. USB-CEA Carkit Audio Uplink Electrical Characteristics

Parameter	Test Conditions	Min	Typ	Max	Unit
Gain range ⁽¹⁾		-1		60	dB
Absolute gain, 0 dBFs at 1.02 kHz ^{(1) (2)}	USB-CEA default gain setting	-1.5		1.5	dB
Speech delay	Voice path		0.5		ms
Input common mode voltage ⁽³⁾	USB-CEA	1.3		1.9	V
Phone microphone amplifier input impedance at 1 kHz	USB-CEA	8	120		kΩ
Peak-to-peak single-ended input voltage (0 dBFs)	Default setting			1.414	V _{PP}
Total harmonic distortion (sine wave at 1 kHz), default gain setting	At -1 dBFs		-74	-60	dB
	At -6 dBFs				
	At -10 dBFs				
	At -20 dBFs				
	At -60 dBFs				
THD+N (20 Hz to 20 kHz, A-weighted)	At 0 dBFs		60		dB
Signal noise ratio (20 Hz to 20 kHz, A-weighted)	At 0 dBFs		60		dB
Idle channel noise (20 Hz to 20 kHz, A-weighted), default gain setting	USB-CEA		-77		dBFs
Output PSRR (20 Hz to 20 kHz, A-weighted)	USB-CEA		50		dB

(1) Gain range is defined by: CEA amplifier = 0.56 to -1.02 dB; Preamplicifier = 0 to 30 dB; Filter = 0 to 31 dB (1-dB steps).

(2) The CEA default gain setting assumes 0 dB on the preamplicifier, 1 dB on digital filter, and CEA amplifier at -1.02 dB.

(3) Full-scale input voltage is 1 V minimum.

6.2.6 Digital Audio Filter Module

Figure 6-12 shows the digital audio filter uplink full path characteristics for the audio interface.

Figure 6-12. Digital Audio Filter Uplink Path Characteristics

The high-pass filter (HPF) can be bypassed. It is controlled by the MISC_SET_2 ATX_HPF_BYP bit set to address 0x49.

Table 6-12 lists the audio filter frequency responses relative to reference gain at 1 kHz.

Table 6-12. Digital Audio Filter TX Electrical Characteristics

Parameter	Test Conditions	Min	Typ	Max	Unit
Passband		0.0005		0.42	F _S
Passband gain	In region 0.0005*F _S to 0.42*F _S ⁽¹⁾	-0.25		0.25	dB
Stopband			0.6		F _S
Stopband attenuation	In region 0.6*F _S to 1*F _S ⁽¹⁾		60		dB
Group delay			15.8/F _S		μs

(1) F_S is the sampling frequency (8, 11.025, 12, 16, 22.05, 24, 32, 44.1, or 48 kHz).

7 USB Transceiver

7.1 USB Transceiver

The TPS65920/TPS65930 device includes a USB OTG transceiver with the CEA carkit interface that supports USB 480 Mbps HS, 12 Mbps full-speed (FS), and USB 1.5 Mbps low-speed (LS) through a 4-pin ULPI.

The carkit block ensures the interface between the phone and a carkit device. The TPS65920/TPS65930 USB supports the CEA carkit standard.

Figure 7-1 is a block diagram of the USB 2.0 physical layer (PHY).

037-011

Figure 7-1. USB 2.0 PHY Block Diagram

7.1.1 Features

The device has a USB OTG carkit transceiver that allows system implementation that complies with the following specifications:

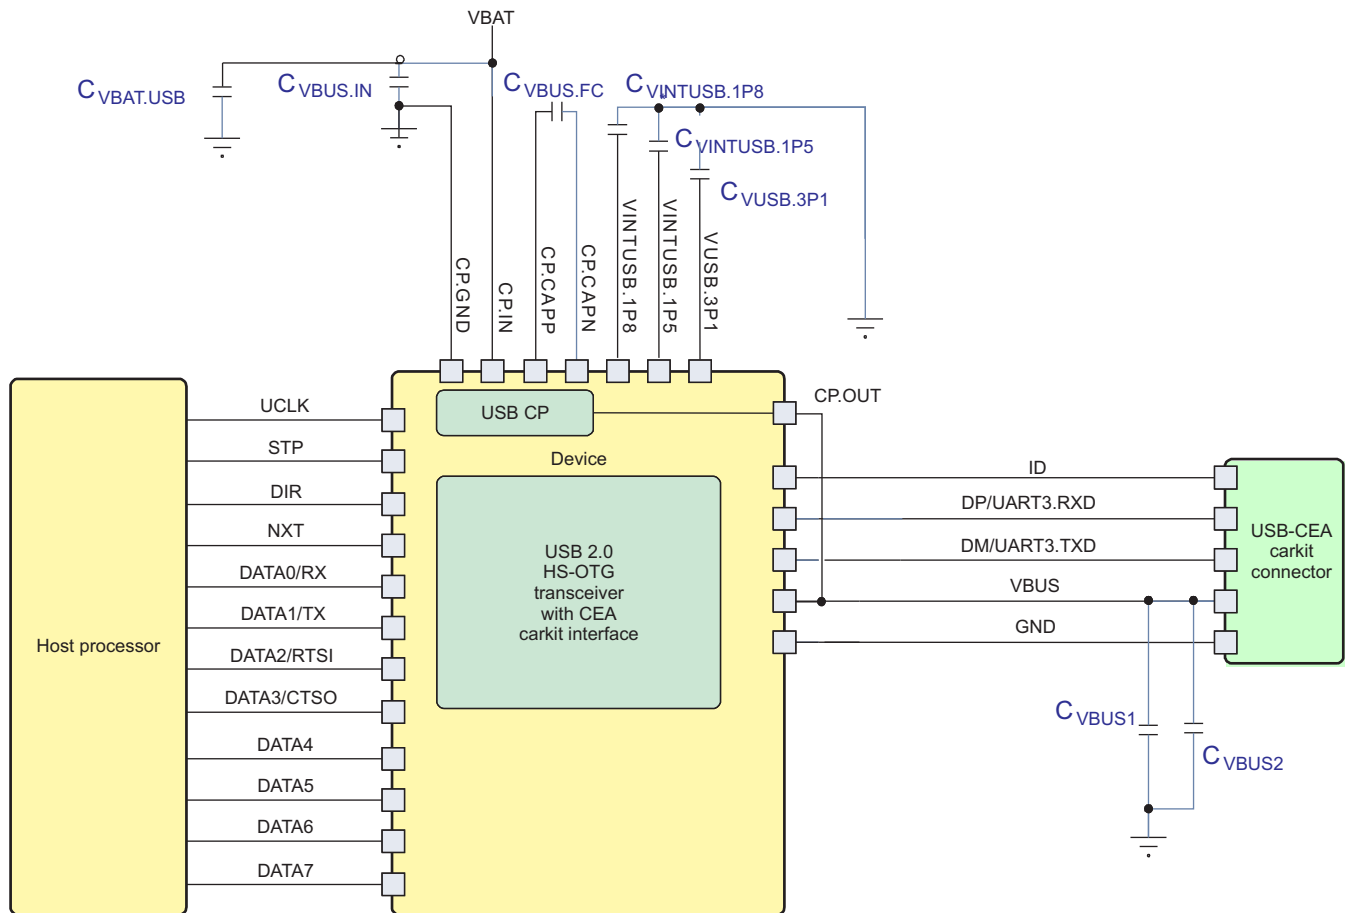

- *Universal Serial Bus 2.0 Specification*
- *On-The-Go Supplement to the USB 2.0 Specification*
- *CEA-2011: OTG Transceiver Interface Specification*
- *CEA-936A: Mini-USB Analog Carkit Specification*
- *UTMI+ Low Pin Interface Specification*

The features of the individual specifications are:

- *Universal Serial Bus 2.0 Specification* (hereafter referred to as the USB 2.0 specification):
 - 5-V-tolerant data line at HS/FS, FS-only, and LS-only transmission rates
 - 7-V-tolerant video bus (VBUS) line
 - Integrated data line serial termination resistors (factory-trimmed)
 - Integrated data line pullup and pulldown resistors
 - On-chip 480-MHz phase-locked loop (PLL) from the internal system clock (19.2, 26, and 38.4 MHz)
 - Synchronization (SYNC)/end-of-period (EOP) generation and checking
 - Data and clock recovery from the USB stream
 - Bit-stuffing/unstuffing and error detection
 - Resume signaling, wakeup, and suspend detection
 - USB 2.0 test modes
- *On-The-Go Supplement to the USB 2.0 Specification* (hereafter referred to as the OTG supplement to the USB 2.0 specification):
 - 3-pin LS/FS serial mode (DAT_SE0)
 - 4-pin LS/FS serial mode (VP_VM)
- *CEA-936A: Mini-USB Analog Carkit Interface Specification*:
 - 5-pin CEA mini-USB analog carkit interface

- UART signaling
- Audio (mono/stereo) signaling
- UART transactions during audio signaling
- Basic and smart 4-wire/5-wire carkit, chargers, and accessories
- ID CEA resistor comparators
- *UTMI+ Low Pin Interface Specification* (hereafter referred to as the ULPI specification):
 - 12-pin ULPI with 8-pin parallel data for USB signaling and register access
 - 60-MHz clock generation
 - Register mapping

Figure 7-2 is the USB system application schematic.

037-012

Figure 7-2. USB System Application Schematic

NOTE

For the component values, see [Table 14-1](#).

7.1.2 HS USB Port Timing

The ULPI interface supports an 8-bit data bus and the internal clock mode. The 4-bit data bus and the external clock mode are not supported.

The HS functional mode supports an operating rate of 480 Mbps.

[Table 7-1](#) and [Table 7-2](#) assume testing over the recommended operating conditions (see [Figure 7-3](#)).

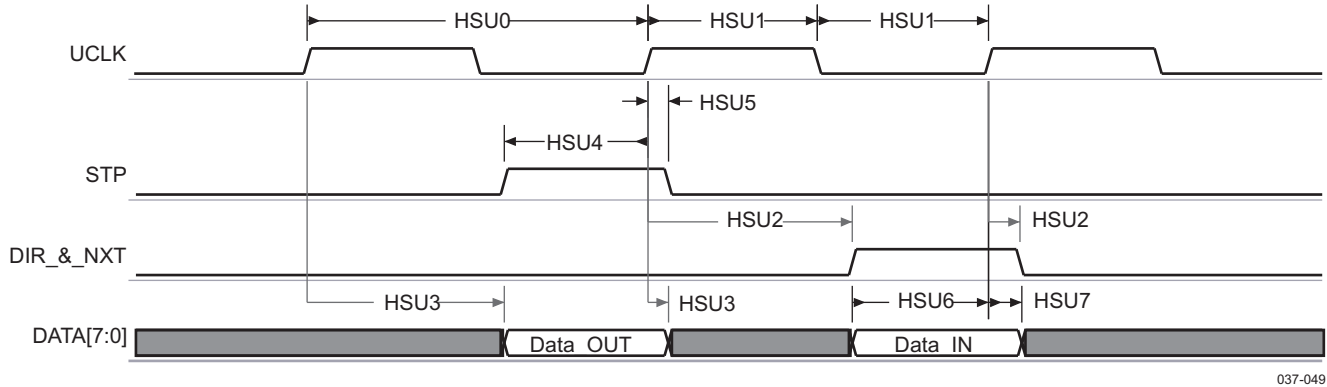

Figure 7-3. HS-USB Interface—Transmit and Receive Modes (ULPI 8-bit)

NOTE

ULPI data [7:0] lines are set to 1 after USB PHY power up, and before the clock signal is stable.

The input timing requirements are given by considering a rising or falling time of 1 ns (see [Table 7-1](#)).

Table 7-1. HS-USB Interface Timing Requirements

Notation	Parameter		Min	Max	Unit
HSU4	$t_{s(STPV-CLKH)}$	Setup time, STP valid before UCLK rising edge	6		ns
HSU5	$t_{h(CLKH-STPIV)}$	Hold time, STP valid after UCLK rising edge	0		ns
HSU6	$t_{s(DATAV-CLKH)}$	Setup time, DATA[0:7] valid before UCLK rising edge	6		ns
HSU7	$t_{h(CLKH-DATIV)}$	Hold time, DATA[0:7] valid after UCLK rising edge	0		ns

[Table 7-2](#) lists the HS-USB interface switching requirements.

Table 7-2. HS-USB Interface Switching Requirements⁽¹⁾

Notation	Parameter ⁽¹⁾			Min	Typ	Max	Unit
HSU0	$f_{p(CLK)}$	UCLK clock frequency	Steady state	58.42	60	61.67	MHz
HSU1	$t_{W(CLK)}$	UCLK duty cycle	Steady state	48.3%	50%	51.7%	
HSU2	$t_{d(CLKH-DIR)}$	Delay time, UCLK rising edge to DIR transition	Steady state	0		9	ns
	$t_{d(CLKH-NXTV)}$	Delay time, UCLK rising edge to NXT transition	Steady state	0		9	ns
HSU3	$t_{d(CLKH-DATIV)}$	Delay time, UCLK rising edge to DATA[0:7] transition	Steady state	0		9	ns

(1) The capacitive load for output data and control load is 10 pF (rising and falling time is 2 ns). The capacitive load for the CLK port is 6 pF (rising and falling time is 1 ns). The HS-USB interface has only one state: the steady state.

7.1.3 USB-CEA CarKit Port Timing

This mode allows the link for communication through the USB PHY to a remote carkit in CEA audio + data during audio (DDA) mode as defined in the CEA-936A specification. In this mode, the ULPI data bus is redefined as a 2-pin UART interface, which exchanges data through a direct access to the FS/LS analog transmitter and receiver.

UART data are sent and received on the USB D+/D- pads. D+/D- are also used in this mode to carry audio I/O signals.

Table 7-3 assumes testing over the recommended operating conditions (see the CEA-936A specification).

Table 7-3. USB-CEA Carkit Interface Timing Parameters

Parameter		Min	Max	Unit
t _{PH_DP_CON}	Phone D+ connect time	100		ms
t _{CR_DP_CON}	Carkit D+ connect time	150	300	ms
t _{PH_DM_CON}	Phone D– connect time		10	ms
t _{PH_CMD_DLY}	Phone command delay	2		ms
t _{PH_MONO_ACK}	Phone mono acknowledge		10	ms
t _{PH_DISC_DET}	Phone D+ disconnect time	150		ms
t _{CR_DISC_DET}	Carkit D– disconnect detect	50	150	ms
t _{PH_AUD_BIAS}	Phone audio bias	1		ms
t _{CR_AUD_DET}	Carkit audio detect	400	800	µs
t _{CR_UART_DET}	Carkit UART detect (data-during-audio enabled)	700	1200	ns
t _{PH_STLO_DET}	Phone stereo D+ low detect	30	100	ms
t _{PH_PLS_POS}	Phone D– interrupt pulse width	200	600	ns
t _{CR_PLS_NEG}	Carkit D+ interrupt pulse width	200	600	ns
t _{DAT_AUD_POL}	Data-during-audio polarity	20	60	ms
t _{ACC_COL_DET}	Accessory ID collision detect	2	3	ms
t _{ACC_INT_PW}	Accessory ID interrupt pulse width	200	400	µs
t _{ACC_INT_WAIT}	Accessory ID interrupt wait time	10	15	ms
t _{ACC_CMD_WAIT}	Accessory ID command wait time	0		ms
t _{PH_INT_PW}	Phone ID interrupt pulse width	4	8	ms
t _{PH_INT_WAIT}	Phone ID interrupt wait time	4	8	ms
t _{PH_CMD_WAIT}	Phone ID command wait time	0		ms
t _{PH_UART_RPT}	Phone command repeat time	50		ms
t _{CR_UART_RSP}	Carkit UART response		30	ms
t _{CR_INT_RPT}	Carkit interrupt repeat time	50		ms
f _{UART_DFLT}	Default UART signaling rate (typical rate)		9600	bps

Figure 7-4 shows the USB-CEA carkit UART data flow.

037-048

Figure 7-4. USB-CEA Carkit UART Data Flow

Table 7-4 lists the USB-CEA carkit UART timings.

Table 7-4. USB-CEA Carkit UART Timings

Notation	Parameter		Min	Max	Unit	
CK1	$t_{d(UART_TXH-DM)}$	Delay time, UART_TX rising edge to DM transition	4.0	11	ns	
CK2	$t_{d(UART_TXL-DM)}$	Delay time, UART_TX falling edge to DM transition	4.0	11	ns	
CK3	$t_{d(DPH-UART_RX)}$	Delay time, DP rising edge to UART_RX transition	At 38.4 MHz	205	234	ns
			At 19.2 MHz	310	364	
CK4	$t_{d(DPL-UART_RX)}$	Delay time, DP falling edge to UART_RX transition	At 38.4 MHz	205	234	ns
			At 19.2 MHz	310	364	

Figure 7-5 shows the USB-CEA carkit UART timings.

Figure 7-5. USB-CEA Carkit UART Timings

7.1.4 PHY Electrical Characteristics

The PHY is the physical signaling layer of the USB 2.0. It contains the drivers and receivers for physical data and protocol signaling on the DP and DM lines.

The PHY interfaces with the USB controller through the UTMI.

The transmitters and receivers in the PHY are of two main classes:

- FS and LS transceivers (legacy USB1.x transceivers)
- HS transceivers

To bias the transistors and run the logic, the PHY also contains reference generation circuitry which consists of:

- A DPLL that does a frequency multiplication to achieve the 480-MHz low-jitter lock necessary for USB, and the clock required for the switched capacitor resistance block
- A switched capacitor resistance block that replicates an external resistor on chip

Built-in pullup and pulldown resistors are used as part of the protocol signaling.

The PHY also contains circuitry that protects it from an accidental 5-V short on the DP and DM lines and from 8-kV IEC ESD strikes.

7.1.4.1 HS Differential Receiver

The HS receiver consists of the following blocks:

- A differential input comparator to receive the serial data
- A squelch detector to qualify the received data
- An oversampler-based clock data recovery scheme followed by a nonreturn to zero inverted (NRZI) decoder, bit unstuffing, and serial-to-parallel converter to generate the UTMI DATAOUT

Table 7-5 lists the characteristics of the HS differential receiver.

Table 7-5. HS Differential Receiver

Parameter		Comments	Min	Typ	Max	Unit
Input Levels for HS						
HS squelch detection threshold	V_{HSSQ}	(Differential signal amplitude)	100	125	150	mV
HS disconnect detection threshold	V_{HSDSC}	(Differential signal amplitude)	525	600	625	mV
HS data signaling common mode voltage range	V_{HSCM}		-50	200	500	mV
HS differential input sensitivity	V_{DIHS}	(Differential signal amplitude)	-100		100	mV
Input Impedance for HS						
Internal specification for input capacitance	C_{HSLOAD}			11		pF
Internal C_{HSLOAD} DP/DM matching	$C_{HSLOADM}$			0.2		pF
External Components With the Total Budget Combined (without USB cable load)						
External capacitance on DP or DM					2	pF
External series resistance on DP or DM					1	Ω

7.1.4.2 HS Differential Transmitter

The HS transmitter is always operated on the UTMI parallel interface. The parallel data on the interface is serialized, bit stuffed, NRZI encoded, and transmitted as a dc output current on DP or DM, depending on the data. Each line has an effective 22.5- Ω load to ground, which generates the voltage levels for signaling.

A disconnect detector is also part of the HS transmitter. A disconnect on the far end of the cable causes the impedance seen by the transmitter to double, thereby doubling the differential amplitude seen on the DP/DM lines.

Table 7-6 lists the characteristics of the HS differential transmitter.

Table 7-6. HS Differential Transmitter

Parameter		Comments	Min	Typ	Max	Unit
Output Levels for HS						
HS TX idle level	V_{HSOI}	Absolute voltage DP/DM – internal/external 45 Ω	-10	0	10	mV
HS TX data signaling high	V_{HSOH}	Absolute voltage DP/DM – internal/external 45 Ω	360	400	440	mV
HS data signaling low	V_{HSOL}		-10	0	10	mV
Chirp J level	V_{CHIRPJ}	Differential voltage	700	800	1100	mV
Chirp K level	V_{CHIRPK}	Differential voltage	-900	-800	-500	mV
HS TX disconnect threshold	$V_{DISCOUT}$	Absolute voltage DP/DM – no external 45 Ω	700			mV
Driver Characteristics						
Rise time	t_{HSR}	(10%–90%)	500			ps
Fall time	t_{HSF}	(10%–90%)	500			ps
Driver output resistance	Z_{HSDRV}	Also serves as HS termination	40.5	45	49.5	Ω

7.1.4.3 CEA/UART Driver

Table 7-7 lists the characteristics of the CEA/UART driver.

Table 7-7. CEA/UART Driver

Parameter		Comments	Min	Typ	Max	Unit
UART Driver CEA						
Phone UART edge rates	t _{PH_UART_EDGE}	DP_PULLDOWN asserted			1	μs
Serial interface output high	V _{OH_SER}	ISOURCE = 4 mA	2.4	3.3	3.6	V
Serial interface output low	V _{OL_SER}	ISINK = –4 mA	0	0.1	0.4	V
Carkit Pulse Driver						
Pulse match tolerance	QPLS_MTCH	ZCR_SPKR_IN = 60 kΩ at f = 1 kHz			5%	
Phone D– interrupt pulse width	t _{PH_PLS_POS}	ZCR_SPKR_IN = 60 kΩ at f = 1 kHz	200		600	ns
Phone positive pulse voltage	V _{PH_PLS_POS}	ZCR_SPKR_IN = 60 kΩ at f = 1 kHz	2.8		3.6	V

7.1.4.4 Pullup/Pulldown Resistors

Table 7-8 lists the characteristics of pullup/pulldown resistors.

Table 7-8. Pullup/Pulldown Resistors

Parameter		Comments	Min	Typ	Max	Unit
Pullup Resistors						
Bus pullup resistor on upstream port (idle bus)	R _{PUI}	Bus idle	0.9	1.1	1.575	kΩ
Bus pullup resistor on upstream port (receiving)	R _{PUA}	Bus driven/driver outputs unloaded	1.425	2.2	3.09	
High (floating)	V _{IHZ}	Pullups/pulldowns on DP and DM lines	2.7		3.6	V
Phone D+ pullup voltage	V _{PH_DP_UP}	Driver outputs unloaded	3	3.3	3.6	V
Pulldown Resistors						
Phone D+/- pulldown	R _{PH_DP_DWN}	Driver outputs unloaded	14.25	18	24.8	kΩ
	R _{PH_DM_DWN}					
High (floating)	V _{IHZ}	Pullups/pulldowns on DP and DM lines	2.7		3.6	V
D+/- Data Line						
Upstream facing port	C _{INUB}	[1.0]		22	75	pF
OTG device leakage	V _{OTG_DATA_LKG}	[2]			0.342	V
Input impedance exclusive of pullup/pulldown ⁽¹⁾	Z _{INP}	Driver outputs unloaded (waiver from USB.ORG Standard Committee)	80	120		kΩ

(1) Waiver received from usb.org standards committee on ZINP 300kmin specification

7.1.5 OTG Electrical Characteristics

The OTG block integrates three main functions:

- The USB plug detection function on VBUS and ID
- The ID resistor detection
- The VBUS level detection

7.1.5.1 OTG VBUS Electrical Characteristics

Table 7-9 lists the electrical characteristics of the OTG VBUS.

Table 7-9. OTG VBUS Electrical Characteristics

Parameter	Comments	Min	Typ	Max	Unit
VBUS Wake-Up Comparator					
VBUS wake-up delay	DEL_VBUS_WK_UP			15	μs
VBUS wake-up threshold	V_VBUS_WK_UP	0.5	0.6	0.7	V
VBUS Comparators					
A-device session valid	V_A_SESS_VLD	0.8	1.1	1.4	V
A-device V _{BUS} valid	V_A_VBUS_VLD	4.4	4.5	4.6	V
B-device session end	V_B_SESS_END	0.2	0.5	0.8	V
B-device session valid	V_B_SESS_VLD	2.1	2.4	2.7	V
VBUS Line					
A-device V _{BUS} input impedance to ground	R_A_BUS_IN	SRP (V _{BUS} pulsing) capable A-device not driving V _{BUS}		100	kΩ
B-device V _{BUS} SRP pulldown	R_B_SRP_DWN	5.25 V/8 mA, pullup voltage = 3 V		0.656	10
B-device V _{BUS} SRP pullup	R_B_SRP_UP	(5.25 V – 3 V)/8 mA, pullup voltage = 3 V		0.281	1
B-device V _{BUS} SRP rise time maximum for OTG-A communication	t _{RISE_SRP_UP_Max}	0 to 2.1 V with < 13 μF load		36	ms
B-device V _{BUS} SRP rise time minimum for standard host connection	t _{RISE_SRP_UP_Min}	0.8 to 2.0 V with > 97 μF load		60	ms
VBUS line maximum voltage		If VBUS_CHRG bit is low		7	V

7.1.5.2 OTG ID Electrical Characteristics

Table 7-10 lists the electrical characteristics of OTG ID.

Table 7-10. OTG ID Electrical Characteristics

Parameter	Comments	Min	Typ	Max	Unit
ID Wake-Up Comparator					
ID wake-up comparator	R_ID_WK_UP	Wake-up when ID shorted to ground through a resistor lower than 445 kΩ (±1%)		445	kΩ
ID Comparators — ID External Resistor Specifications					
ID ground comparator	R_ID_GND	ID_GND interrupt when ID shorted to ground through a resistor lower than 10 Ω		0	5
ID 100k comparators	R_ID_100K	ID_100K interrupt when 102 kΩ (1%) resistor plugged in		101	102
ID 200k comparators	R_ID_200K	ID_200K interrupt when 200 kΩ (1%) resistor plugged in		198	200
ID 440k comparators	R_ID_440K	ID_440K interrupt when 440 kΩ (1%) resistor plugged in		435	440
ID Float comparator	R_ID_FLOAT	ID_FLOAT interrupt when ID shorted to ground through a resistor higher than 560 kΩ		1400	
ID Line					
Phone I _D pullup to V _{PH_ID_UP}	R_PH_ID_UP	ID unloaded (VRUSB)		70	200
Phone I _D pullup voltage	V_PH_ID_UP	Connected to VRUSB		2.5	3.2
ID line maximum voltage				5.25	V

8 MADC

8.1 General Description

The TPS65920/TPS65930 device provides the MADC resource to the host processors in the system (hardware and software conversion modes).

The MADC generates interrupt signals to the host processors. Interrupts are handled primarily by the MADC internal secondary interrupt handler and secondly at the upper level (outside the MADC) by the TPS65920/TPS65930 interrupt primary handler.

8.2 MADC Electrical Characteristics

Table 8-1 lists the electrical characteristics of the MADC.

Table 8-1. MADC Electrical Characteristics

Parameter	Conditions	Min	Typ	Max	Unit
Resolution			10		Bit
ADIN2 input dynamic range for external input		0		2.5	V
MADC voltage reference			1.5		V
ADIN0 differential nonlinearity		–1		1	LSB
ADIN0 integral nonlinearity	Best fitting	–2		2	LSB
Integral nonlinearity for ADIN2	Best fitting for codes 230 to maximum	–2		2	LSB
	Best fitting considering offset of 25 LSB	–3.75		3.75	LSB
Offset	Best fitting	–28.5		28.5	mV
Input bias			1		μA
Input capacitor C _{BANK}				10	pF
Maximum source input resistance R _s (for all 16 internal or external inputs)				100	kΩ
Input current leakage (for all 16 internal or external inputs)				1	μA

8.3 Channel Voltage Input Range

Table 8-2 lists the analog input voltage minimum and maximum values.

Table 8-2. Analog Input Voltage Range

Channel	Min	Typ	Max	Unit	Prescaler
ADIN0: General-purpose input	0		1.5	V	No prescaler DC current source for battery identification through external resistor (10 μ A typical)
ADIN2: General-purpose input ⁽¹⁾	0		2.5	V	Prescaler in the MADC to be in range 0 to >1.5 V

(1) General-purpose inputs must be tied to ground when TPS65920/TPS65930 internal power supplies (VINTANA1 and VINTANA2) are off.

8.3.1 Sequence Conversion Time (Real-Time or Nonaborted Asynchronous)

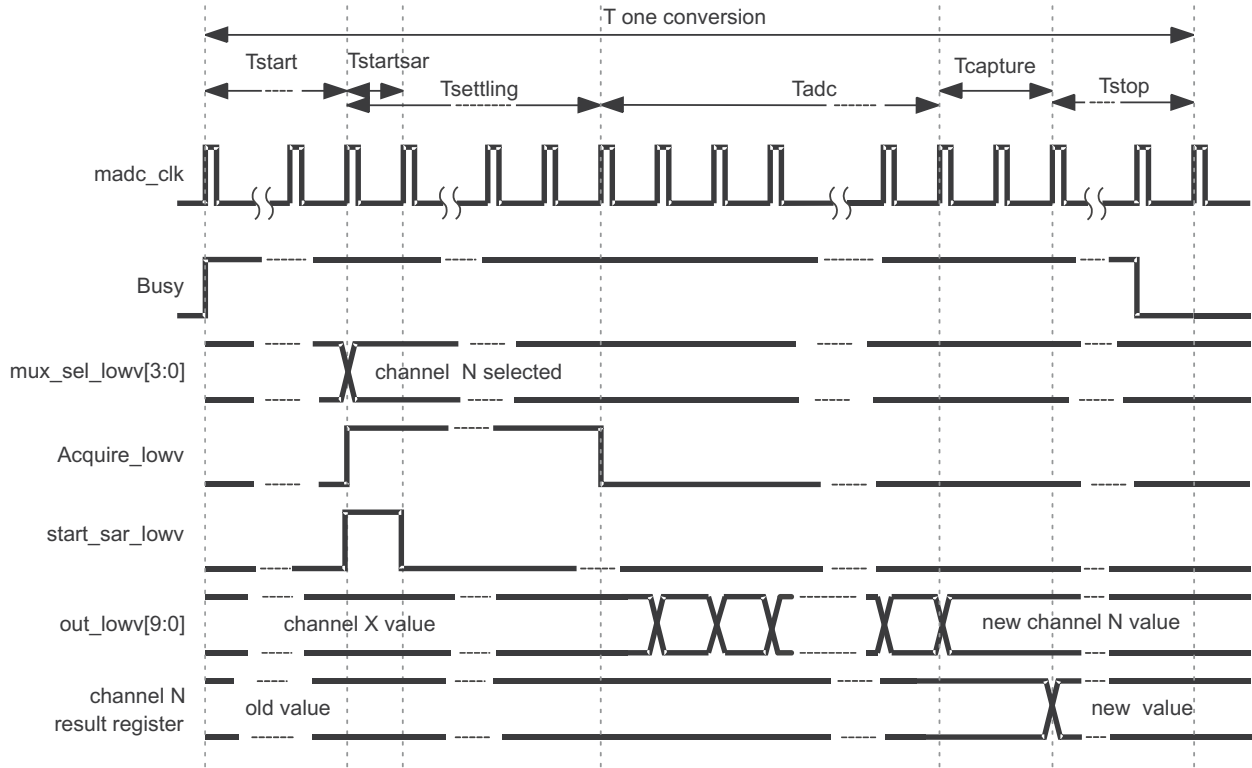

Table 8-3 lists the sequence conversion timing characteristics.

Table 8-3. Sequence Conversion Timing Characteristics

Parameter	Comments	Min	Typ	Max	Unit
F	Running frequency		1		MHz
T = 1/F	Clock period		1		μ s
N	Number of analog inputs to convert in a single sequence	0		2	
Tstart	SW1, SW2, or USB asynchronous request or real-time STARTADC request	3		4	μ s
Tsettling time	Settling time to wait before sampling a stable analog input (capacitor bank charge time) Tsettling is calculated from the $\max((R_s + R_{on}) \cdot C_{bank})$ of the two possible input sources (internal or external). R_{on} is the resistance of the selection analog input switches (5 k Ω). This time is software-programmable by the open-core protocol (OCP) register.	5	12	20	μ s
Tstartsar	The successive approximation registers ADC start time		1		μ s
Tadc time	The successive approximation registers ADC conversion time		10		μ s
Tcapture time	Tcapture time is the conversion result capture time.		2		μ s
Tstop		1		2	μ s
Full-conversion sequence time	One channel (N = 1) ⁽¹⁾	22		39	μ s
	Both channels ⁽¹⁾	352		624	
Conversion sequence time	Without Tstart and Tstop: One channel (N = 1) ⁽¹⁾	18		33	μ s
	Without Tstart and Tstop: Both channels ⁽¹⁾	288		528	
STARTADC pulse duration	STARTADC period is T.	0.33		24	μ s

(1) Total sequence conversion time general formula: Tstart+N*(1+Tsettling+Tadc+Tcapture) +Tstop

Table 8-3 is illustrated in Figure 8-1, which is a conversion sequence general timing diagram. The *Busy* parameter indicates that a conversion sequence is running, and the *channel N result register* parameter corresponds to the result register of the RT/GP selected channel.

037-046

Figure 8-1. Conversion Sequence General Timing Diagram

9 LED Drivers

9.1 General Description

Two arrays of parallel LEDs are driven (dedicated for the phone light). The parallel LEDs are supplied by VBAT, and the external resistor value is given for each LED. The TPS65920/TPS65930 device supports two open-drain LED drivers for the keypad backlight, having drain connections tolerant of the main battery voltage.

Figure 9-1 is the LED driver block diagram. Table 9-1 lists the electrical characteristics of the LED driver.

Figure 9-1. LED Driver Block Diagram

NOTE

For the component values, see Table 14-1.

Table 9-1. LED Driver Electrical Characteristics

Parameter	Conditions	Min	Typ	Max	Unit
SW On resistance	$I_O = 160 \text{ mA}$		3	4	Ω
	$I_O = 60 \text{ mA}$		10	12	

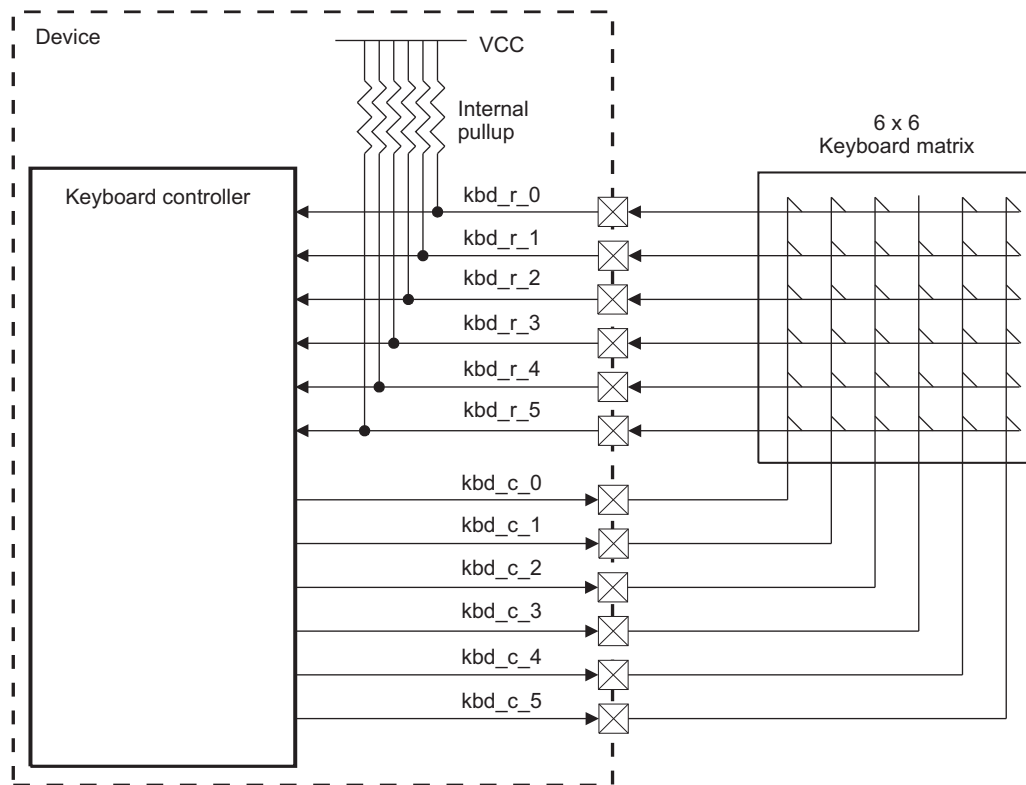

10 Keyboard

10.1 Keyboard Connection

The keyboard is connected to the chip using:

- KBR (5 :0) input pins for row lines
- KBC (5 :0) output pins for column lines

Figure 10-1 shows the keyboard connection.

037-014

Figure 10-1. Keyboard Connection

When a key button of the keyboard matrix is pressed, the corresponding row and column lines are shorted together. To allow key press detection, all input pins (KBR) are pulled up to V_{CC} and all output pins (KBC) are driven to a low level.

Any action on a button generates an interrupt to the sequencer.

The decoding sequence is written to allow detection of simultaneous press actions on several key buttons.

The keyboard interface can be used with a smaller keyboard area than 6 x 6. To use a 3 x 3 keyboard, KBR(4) and KBR(5) must be tied high to prevent any scanning process distribution.

11 Clock Specifications

The TPS65920/TPS65930 device includes several I/O clock pins. The TPS65920/TPS65930 device has two sources of high-stability clock signals: the external high-frequency clock (HFCLKIN) input and an onboard 32-kHz oscillator (an external 32-kHz signal can be provided). Figure 11-1 is the clock overview.

030-002

Figure 11-1. Clock Overview

11.1 Clock Features

The TPS65920/TPS65930 device accepts two sources of high-stability clock signals:

- 32KXIN/32KXOUT: Onboard 32-kHz crystal oscillator (an external 32-kHz input clock can be provided)
- HFCLKIN: External high-frequency clock (19.2, 26, or 38.4 MHz).

The TPS65920/TPS65930 device can provide:

- 32KCLKOUT digital output clock
- HFCLKOUT digital output clock with the same frequency as the HFCLKIN input clock

11.2 Input Clock Specifications

The clock system accepts two input clock sources:

- 32-kHz crystal oscillator clock or sinusoidal/squared clock
- HFCLKIN high-frequency input clock

11.2.1 Clock Source Requirements

Table 11-1 lists the input clock requirements.

Table 11-1. TPS65920/TPS65930 Input Clock Source Requirements

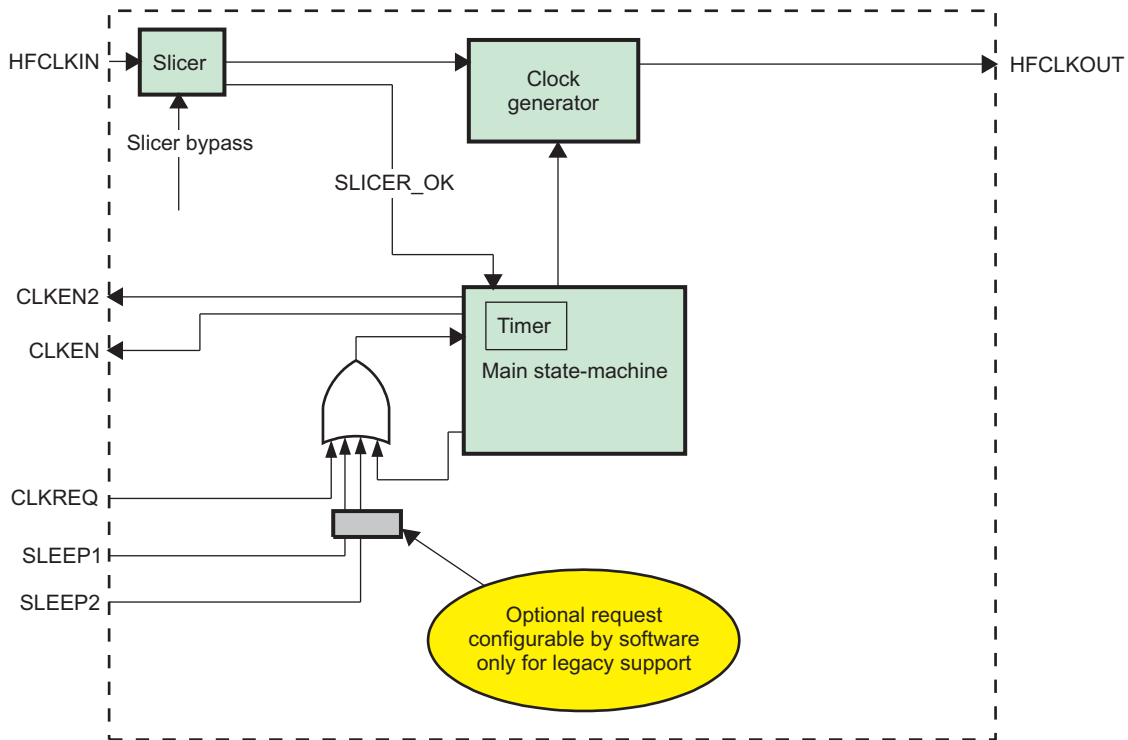

Pad	Clock Frequency	Stability	Duty Cycle
32KXIN 32KXOUT	32.768 kHz	Crystal	±30 ppm
		Square wave	–
		Sine wave	–
HFCLKIN	19.2, 26, 38.4 MHz	Square wave	±150 PPM
		Sine wave	–

(1) HFCLK duty cycle and frequency is not altered by the internal circuit. The input clock accuracy must match that of the system requirement; for example, OMAP device.

11.2.2 HFCLKIN

HFCLKIN can be a square- or a sine-wave input clock. If a square-wave input clock is provided, it is recommended to switch the block to bypass mode to avoid loading the clock.

Figure 11-2 shows the HFCLKIN clock distribution.

037-044

Figure 11-2. HFCLKIN Clock Distribution

When a device needs a clock signal other than 32.768 kHz, it makes a clock request and activates the

CLKREQ pin. As a result, the TPS65920/TPS65930 device immediately sets CLKEN to 1 to warn the clock provider in the system about the clock request and starts a timer (maximum of 5.2 ms using the 32.768-kHz clock). When the timer expires, the TPS65920/TPS65930 device opens a gated clock, the timer automatically reloads the defined value, and a high-frequency output clock signal is available through the HFCLKOUT pin. The output drive of HFCLKOUT is programmable (minimum load 10 pF, maximum load 40 pF) and must be at 40 pF by default.

With a register setting, the mirroring of CLKEN can be enabled on CLKEN2. When this mirroring feature is not enabled, CLKEN2 can be used as a general-purpose output controlled through I²C accesses.

CLKREQ, when enabled, has a weak pulldown resistor to support the wired-OR clock request.

Figure 11-3 shows an example of the wired-OR clock request.

037-043

Figure 11-3. Example of Wired-OR Clock Request

The timer default value must be the worst case (10 ms) for the clock providers. For legacy or workaround support, the NSLEEP1 and NSLEEP2 signals can also be used as a clock request even if it is not their primary goal. By default, this feature is disabled and must be enabled individually by setting the register bits associated with each signal.

When the external clock signal is present on the HFCLKIN ball, it is possible to use this clock instead of the internal RC oscillator and then synchronize the system on the same clock. The RC oscillator can then go to idle mode.

Table 11-2 lists the input clock electrical characteristics of the HFCLKIN input clock.

Table 11-2. HFCLKIN Input Clock Electrical Characteristics

Parameter Description		Configuration Mode Slicer	Min	Typ	Max	Unit
Frequency			19.2, 26, or 38.4			MHz
Start-up time		LP ⁽¹⁾ /HP ⁽²⁾ (sine wave)	4			µs
Input dynamic range		LP/HP (sine wave)	0.3	0.7	1.45	V _{PP}
		BP ⁽³⁾ /PD ⁽⁴⁾ (square wave)	0			
Current consumption		LP	175			µA
		HP	235			
		BP/PD	39			nA
Harmonic content of input signal (with 0.7-V _{PP} amplitude): second component		LP/HP (sine wave)	-25			dBc
V _{IH}	Voltage input high	BP (square wave)	1			V
V _{IL}	Voltage input low	BP (square wave)	0.6			V

- (1) LP = Low-power mode
- (2) HP = High-power mode
- (3) BP = Bypass mode
- (4) PD = Power-down mode
- (5) Bypass input max voltage is the same as the maximum voltage provided for the I/O interface (IO.1P8V).

Table 11-3 lists the input clock timing requirements of the HFCLKIN input clock when the source is a square wave. Figure 11-4 shows the HFCLKIN squared input clock timings.

Table 11-3. HFCLKIN Square Input Clock Timing Requirements with Slicer in Bypass

Name	Parameter	Description	Min	Typ	Max	Unit
CH0	1/t _{C(HFCLKIN)}	Frequency, HFCLKIN	19.2, 26, or 38.4			MHz
CH1	t _{W(HFCLKIN)}	Pulse duration, HFCLKIN low or high	0.45*t _{C(HFCLKIN)}		0.55*t _{C(HFCLKIN)}	ns
CH3	t _{R(HFCLKIN)}	Rise time, HFCLKIN ⁽¹⁾	5			ns
CH4	t _{F(HFCLKIN)}	Fall time, HFCLKIN ⁽¹⁾	5			ns

- (1) Default drive capability is 40 pF.

Figure 11-4. HFCLKIN Squared Input Clock

11.2.3 32-kHz Input Clock

A 32.768-kHz input clock (often abbreviated to 32-kHz) generates the clocks for the RTC. It has a low-jitter mode where the current consumption increases for lower jitter. It is possible to use the 32-kHz input clock with an external crystal or clock source. Depending on the mode chosen, the 32K oscillator is configured one of two ways:

- An external 32.768-kHz crystal through the 32KXIN/32KXOUT balls (see Figure 11-5). This configuration is available only for master mode (for more information, see Section 12).
- An external square/sine wave of 32.768 kHz through 32KXIN with amplitude equal to 1.8 or 1.85 V (see Figure 11-7, Figure 11-8, and Figure 11-9). This configuration is available for the master and slave modes (for more information, see Section 12).

11.2.3.1 External Crystal Description

Figure 11-5 shows the 32-kHz oscillator block diagram with crystal in master mode.

037-042

NOTE: Switches close by default and open only if register access enables very-low-power mode when VBAT < 2.7 V.

Figure 11-5. 32-kHz Oscillator Block Diagram In Master Mode With Crystal

CXIN and CXOUT represent the total capacitance of the printed circuit board (PCB) and components, excluding the crystal. Their values depend on the datasheet of the crystal, the internal capacitors, and the parallel capacitor. The frequency of the oscillations depends on the value of the capacitors. The crystal must be in the fundamental mode of operation and parallel resonant.

NOTE

For the values of CXIN and CXOUT, see [Table 14-1](#).

[Table 11-4](#) lists the required electrical constraints.

Table 11-4. Crystal Electrical Characteristics

Parameter	Min	Typ	Max	Unit
Parallel resonance crystal frequency		32.768		kHz
Input voltage, V_{in} (normal mode)	1.0	1.3	1.55	V
Internal capacitor on each input (C_{int})		10		pF
Parallel input capacitance (C_{pin})			1	pF
Nominal load cap on each oscillator input CXIN and CXOUT ⁽¹⁾	$CXIN = CXOUT = C_{osc} * 2 - (C_{int} + C_{pin})$			pF
Pin-to-pin capacitance		1.6	1.8	pF

(1) Nominal load capacitor on each oscillator input defined as $CXIN = CXOUT = C_{osc} * 2 - (C_{int} + C_{pin})$. C_{osc} is the load capacitor defined in the crystal oscillator specification, C_{int} is the internal capacitor, and C_{pin} is the parallel input capacitor.

Table 11-4. Crystal Electrical Characteristics (continued)

Parameter	Min	Typ	Max	Unit
Crystal ESR ⁽²⁾			75	kΩ
Crystal shunt capacitance, C _O			1	pF
Crystal tolerance at room temperature, 25°C	-30		30	ppm
Crystal tolerance versus temperature range (-40°C to 85°C)	-200		200	ppm
Maximum drive power			1	μW
Operating drive level			0.5	μW

(2) The crystal motional resistance R_m relates to the equivalent series resistance (ESR) by the following formula:

$$ESR = R_m \left(1 + \frac{C_O}{C_L} \right)^2$$

Measured with the load capacitance specified by the crystal manufacturer. If CXIN = CXOUT = 10 pF, C_L = 5 pF. Parasitic capacitance from the package and board must also be considered.

When selecting a crystal, the system design must consider the temperature and aging characteristics of a crystal versus the user environment and expected lifetime of the system.

Table 11-5 and Table 11-6 list the switching characteristics of the oscillator and the timing requirements of the 32.768-kHz input clock. Figure 11-6 shows the crystal oscillator output in normal mode.

Table 11-5. Base Oscillator Switching Characteristics

Name	Parameter Description		Min	Typ	Max	Unit
f _p	Oscillation frequency			32.768		kHz
t _{sx}	Start-up time				0.5	s
I _{DDA}	Active current consumption	LOJIT <1:0> = 00			1.8	μA
		LOJIT <1:0> = 11			8	
I _{DDQ}	Current consumption	Low battery mode (1.2 V)			1	μA
		Startup			8	

Table 11-6. 32-kHz Crystal Input Clock Timing Requirements

Name	Parameter Description		Min	Typ	Max	Unit
OC0	1/t _{C(32KHZ)}	Frequency, 32 kHz		32.768		kHz
OC1	t _{W(32KHZ)}	Pulse duration, 32 kHz low or high	0.40*t _{C(32KHZ)}		0.60*t _{C(32KHZ)}	μs

Figure 11-6. 32-kHz Crystal Input

11.2.3.2 External Clock Description

When an external 32K clock is used instead of a crystal, three configuration can be used:

- A square- or sine-wave input can be applied to the 32KXIN pin with amplitude of 1.85 or 1.8 V. The 32KXOUT pin can be driven to a dc value of the square- or sine-wave amplitude divided by 2. This configuration, shown in Figure 11-7, is recommended if a large load is applied on the 32KXOUT pin.
- A square- or sine-wave input can be applied to the 32KXIN pin with amplitude of 1.85 or 1.8 V. The 32KXOUT pin can be left floating. This configuration, showed in Figure 11-8, is used if no charge is applied on the 32KXOUT pin.
- The oscillator is in bypass mode and a square-wave input can be applied to the 32KXIN pin with amplitude of 1.8 V. The 32KXOUT pin can be left floating. This configuration, shown in Figure 11-9, is

used if the oscillator is in bypass mode.

037-041

(1) Switches close by default and open only if register access enables very-low-power mode when VBAT < 2.7 V.

Figure 11-7. 32-kHz Oscillator Block Diagram Without Crystal Option 1

037-039

(1) Switches close by default and open only if register access enables very-low-power mode when VBAT < 2.7 V.

Figure 11-9. 32-kHz Oscillator in Bypass Mode Block Diagram Without Crystal Option 3

Table 11-7 lists the electrical constraints required by the 32-kHz input square- or sine-wave clock.

Table 11-7. 32-kHz Input Square- or Sine-Wave Clock Source Electrical Characteristics

Name	Parameter Description	Min	Typ	Max	Unit
f	Frequency		32.768		kHz
C _I	Input capacitance		35		pF
C _{FI}	On-chip foot capacitance to GND on each input (see Figure 11-7, Figure 11-8, and Figure 11-9)		10		pF
V _{PP}	Square-/sine-wave amplitude in bypass mode or not		1.8 ⁽¹⁾		V
V _{IH}	Voltage input high, square wave in bypass mode	0.8			V
V _{IL}	Voltage input low, square wave in bypass mode			0.6	V

(1) Bypass input maximum voltage is the same as the maximum voltage provided for the I/O interface.

Table 11-8 lists the timing requirements of the 32-kHz square-wave input clock.

Table 11-8. 32-kHz Square-Wave Input Clock Source Timing Requirements

Name	Parameter	Description	Min	Typ	Max	Unit
CK0	1/t _{C(32KHZ)}	Frequency, 32 kHz		32.768		MHz
CK1	t _{W(32KHZ)}	Pulse duration, 32 kHz low or high	0.45*t _{C(32KHZ)}		0.55*t _{C(32KHZ)}	μs
CK3	t _{R(32KHZ)}	Rise time, 32 kHz ⁽¹⁾			0.1*t _{C(32KHZ)}	μs
CK4	t _{F(32KHZ)}	Fall time, 32 kHz ⁽¹⁾			0.1*t _{C(32KHZ)}	μs

(1) The capacitive load is 30 pF.

Figure 11-10 shows the 32-kHz square- or sine-wave input clock.

Figure 11-10. 32-kHz Square- or Sine-Wave Input Clock

11.3 Output Clock Specifications

The TPS65920/TPS65930 device provides two output clocks:

- 32KCLKOUT
- HFCLKOUT

11.3.1 32KCLKOUT Output Clock

Figure 11-11 is the block diagram for the 32.768-kHz clock output.

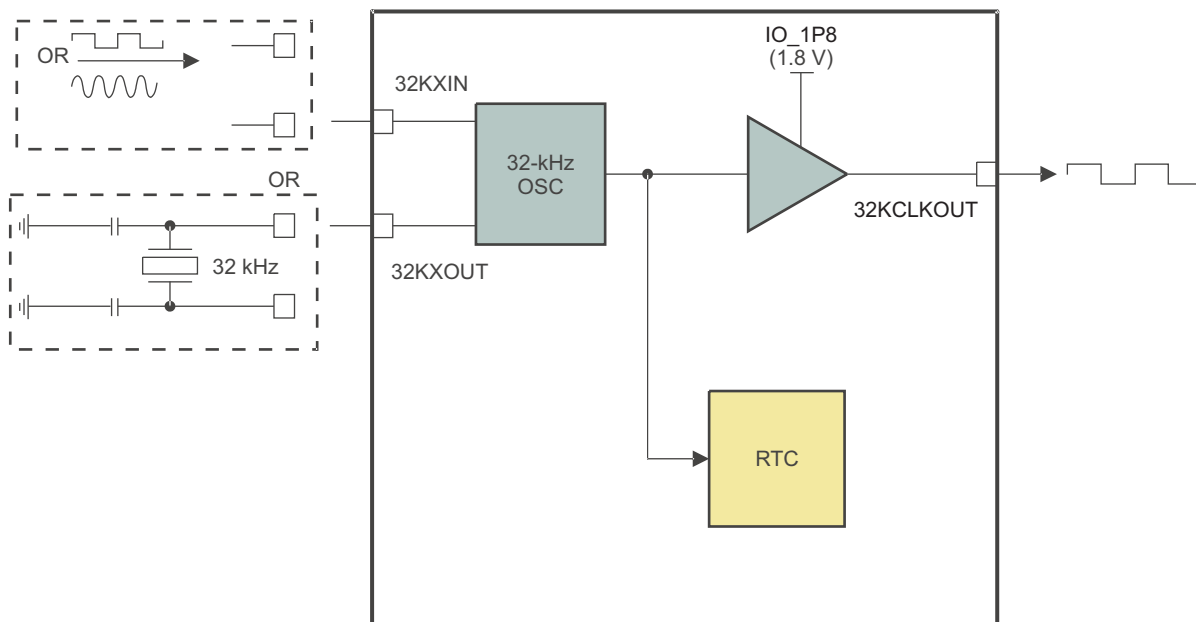

Figure 11-11. 32.768-kHz Clock Output Block Diagram

The TPS65920/TPS65930 device has an internal 32.768-kHz oscillator connected to an external 32.768-kHz crystal through the 32KXIN/32KXOUT balls or an external digital 32.768-kHz clock through the 32KXIN input (see Figure 11-11). The TPS65920/TPS65930 device also generates a 32.768-kHz digital clock through the 32KCLKOUT pin and can broadcast it externally to the application processor or any other devices. The 32KCLKOUT clock is broadcast by default in TPS65920/TPS65930 active mode, but can be disabled if it is not used.

The 32.768-kHz clock (or signal) is also used to clock the RTC embedded in the TPS65920/TPS65930 device. The RTC is not enabled by default. The host processor must set the correct date and time and enable the RTC functionality.

The 32KCLKOUT output buffer can drive several devices (up to 40-pF load). At startup, 32KCLKOUT must be stabilized (frequency/duty cycle) before the signal output. Depending on the startup conditions, this can delay the startup sequence.

Table 11-9 lists the electrical characteristics of the 32KCLKOUT output clock.

Table 11-9. 32KCLKOUT Output Clock Electrical Characteristics

Name	Parameter Description	Min	Typ	Max	Unit
f	Frequency		32.768		kHz
C _L	Load capacitance			40	pF
V _{OUT}	Output clock voltage, depending on output reference level IO_1P8 (see Section 2)		1.8 ⁽¹⁾		V
V _{OH}	Voltage output high	V _{OUT} – 0.45		V _{OUT}	V
V _{OL}	Voltage output low	0		0.45	V

(1) The output voltage depends on the output reference level, which is IO_1P8 (see Section 2, Terminal Description).

Table 11-10 lists the output clock switching characteristics. Figure 11-12 shows the 32KCLKOUT output clock waveform.

Table 11-10. 32KCLKOUT Output Clock Switching Characteristics

Name	Parameter	Description	Min	Typ	Max	Unit
CK0	1/t _{C(32KCLKOUT)}	Frequency		32.768		MHz
CK1	t _{W(32KCLKOUT)}	Pulse duration, 32KCLKOUT low or high	0.40*t _{C(32KCLKOUT)}		0.60*t _{C(32KCLKOUT)}	ns
CK2	t _{R(32KCLKOUT)}	Rise time, 32KCLKOUT ⁽¹⁾			16	ns
CK3	t _{F(32KCLKOUT)}	Fall time, 32KCLKOUT ⁽¹⁾			16	ns

(1) The output capacitive load is 30 pF.

Figure 11-12. 32KCLKOUT Output Clock

11.3.2 HFCLKOUT Output Clock

Table 11-11 lists the electrical characteristics of the HFCLKOUT output clock.

Table 11-11. HFCLKOUT Output Clock Electrical Characteristics

Name	Parameter Description	Min	Typ	Max	Unit
f	Frequency	19.2, 26, or 38.4			MHz
C _L	Load capacitance			30	pF
V _{OUT}	Output clock voltage, depending on output reference level IO_1P8 (see Section 2)		1.8 ⁽¹⁾		V
V _{OH}	Voltage output high	V _{OUT} – 0.45		V _{OUT}	V
V _{OL}	Voltage output low	0		0.45	V

(1) The output voltage depends on the output reference level, which is IO_1P8 (see Section 2).

Table 11-12 lists the switching characteristics of the HFCLKOUT output clock.

Table 11-12. HFCLKOUT Output Clock Switching Characteristics

Name	Parameter	Description	Min	Typ	Max	Unit
CHO1	1/t _{C(HFCLKOUT)}	Frequency		19.2, 26, or 38.4		MHz
CHO2	t _{W(HFCLKOUT)}	Pulse duration, HFCLKOUT low or high	0.40*t _{C(HFCLKOUT)}		0.60*t _{C(HFCLKOUT)}	ns
CHO3	t _{R(HFCLKOUT)}	Rise time, HFCLKOUT ⁽¹⁾			2.6	ns
CHO4	t _{F(HFCLKOUT)}	Fall time, HFCLKOUT ⁽¹⁾			2.6	ns

(1) The output capacitive load is 30 pF.

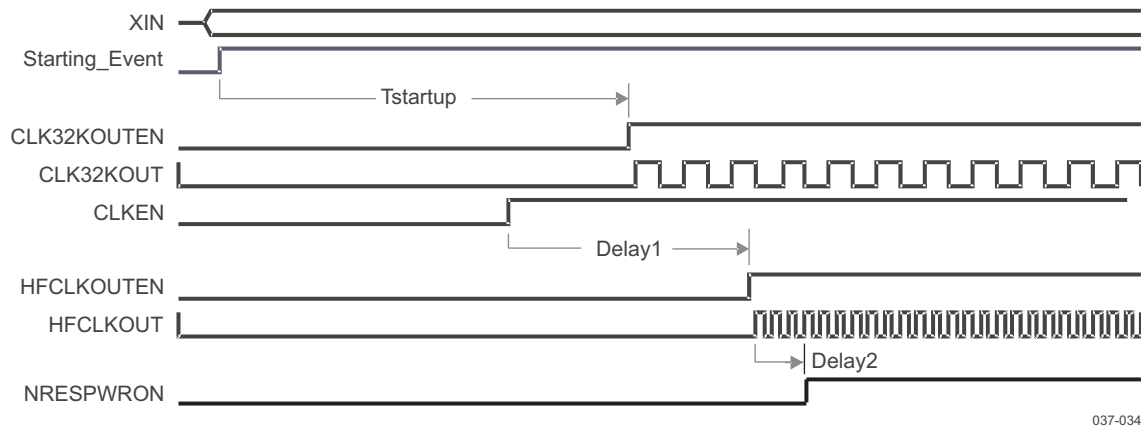

Figure 11-13 shows the HFCLKOUT output clock waveform.

Figure 11-13. HFCLKOUT Output Clock

11.3.3 Output Clock Stabilization Time

Figure 11-14 shows the 32KCLKOUT and HFCLKOUT clock stabilization time.

NOTE: Tstartup, Delay1, and Delay2 depend on the boot mode (see Section 4.5, Power Management).

NOTE: Ensure that the high frequency oscillator start-up time is in spec for the boot mode used. During power-up the internal delay, Delay1 above is fixed (5.2 ms and 5.3 ms depending on boot mode). The start-up time for the oscillator must be less than the fixed delay.

Figure 11-14. 32KCLKOUT and HFCLKOUT Clock Stabilization Time

Figure 11-15 shows the HFCLKOUT behavior.

Figure 11-15. HFCLKOUT Behavior

12 Timing Requirements and Switching Characteristics

12.1 Timing Parameters

The timing parameter symbols used in the timing requirement and switching characteristic tables are created in accordance with JEDEC Standard 100. To shorten the symbols, some pin names and other related terminologies are abbreviated, as shown in [Table 12-1](#).

Table 12-1. Timing Parameters

Subscripts	
Symbol	Parameter
c	Cycle time (period)
d	Delay time
dis	Disable time
en	Enable time
h	Hold time
su	Setup time
START	Start bit
t	Transition time
v	Valid time
w	Pulse duration (width)
X	Unknown, changing, or don't care level
H	High
L	Low
V	Valid
IV	Invalid
AE	Active edge
FE	First edge
LE	Last edge
Z	High impedance

12.2 Target Frequencies

Table 12-2 assumes testing over the recommended operating conditions.

Table 12-2. TPS65920/TPS65930 Interface Target Frequencies

I/O Interface	Interface Designation		Target Frequency 1.5 V
SmartReflex inter-integrated circuit (I ² C™) General-purpose I ² C	I ² C	Slave HS mode	3.6 Mbps
		Slave fast-speed mode	400 Kbps
		Slave standard mode	100 Kbps
USB	USB	HS	480 Mbps
		FS	12 Mbps
		LS	1.5 Mbps
JTAG	Real/View® ICE tool		30 MHz
	XDS560 and XDS510 tools		30 MHz
	Lauterbach™ tool		30 MHz
TDM/inter-IC sound (I2S™)	I2S		$1/(64 * F_s)^{(1)}$
	Right-justified		$1/(64 * F_s)^{(1)}$
	Left-justified		$1/(64 * F_s)^{(1)}$
	TDM		$1/(128 * F_s)^{(1)}$
Voice/Bluetooth® pulse code modulation (PCM) interface	PCM (master mode)		$1/(65 * F_s)^{(2)}$
	PCM (slave mode)		$1/(33 \text{ to } 65 * F_s)^{(2)}$

(1) F_s = 8 to 48 kHz; 96 kHz for RX path only (TDM/I2S interface)

(2) F_s = 8 or 16 kHz (voice/Bluetooth PCM interface)

12.3 I²C Timing

The TPS65920/TPS65930 device provides two I²C HS slave interfaces (one for general-purpose and one for SmartReflex). These interfaces support standard mode (100 Kbps), fast mode (400 Kbps), and HS mode (3.4 Mbps). The general-purpose I²C module embeds four slave hard-coded addresses (ID1 = 48h, ID2 = 49h, ID3 = 4Ah, and ID4 = 4Bh). The SmartReflex I²C module uses one slave hard-coded address (ID5). The master mode is not supported.

Table 12-3 and Table 12-4 assume testing over the recommended operating conditions (see Figure 12-1).

Figure 12-1. I²C Interface—Transmit and Receive in Slave Mode

Table 12-3. I²C Interface—Timing Requirements⁽¹⁾ ⁽²⁾

Notation	Parameter	Min	Max	Unit
Slave HS Mode				
I3	t _{su} (SDA-SCLH)	10		ns
I4	t _h (SCLL-SDA)	0	70	ns
I7	t _{su} (SCLH-SDAL)	160		ns
I8	t _h (SDAL-SCLL)	160		ns
I9	t _{su} (SDAH-SCLH)	160		ns
Slave Fast-Speed Mode				
I3	t _{su} (SDA-SCLH)	100		ns
I4	t _h (SCLL-SDA)	0	0.9	ns
I7	t _{su} (SCLH-SDAL)	0.6		ns
I8	t _h (SDAL-SCLL)	0.6		ns
I9	t _{su} (SDAH-SCLH)	0.6		ns
Slave Standard Mode				
I3	t _{su} (SDA-SCLH)	250		ns
I4	t _h (SCLL-SDA)	0		ns
I7	t _{su} (SCLH-SDAL)	4.7		ns
I8	t _h (SDAL-SCLL)	4		ns
I9	t _{su} (SDAH-SCLH)	4		ns

(1) The input timing requirements are given by considering a rising or falling time of:
 80 ns in HS mode (3.4 Mbps)
 300 ns in fast-speed mode (400 Kbps)
 1000 ns in standard mode (100 Kbps)

(2) SDA is equal to I2C.SR.SDA or I2C.CNTL.SDA.
 SCL is equal to I2C.SR.SCL or I2C.CNTL.SCL.

Table 12-4 lists the switching requirements of the I²C interface.

Table 12-4. I²C Interface—Switching Requirements⁽¹⁾ (2)

Notation	Parameter		Min	Max	Unit
Slave HS Mode					
I1	$t_{w(SCLL)}$	Pulse duration, SCL low	160		ns
I2	$t_{w(SCLH)}$	Pulse duration, SCL high	60		ns
Slave Fast-Speed Mode					
I1	$t_{w(SCLL)}$	Pulse duration, SCL low	1.3 ⁽³⁾		μs
I2	$t_{w(SCLH)}$	Pulse duration, SCL high	0.6		μs
Slave Standard Mode					
I1	$t_{w(SCLL)}$	Pulse duration, SCL low	4.7		μs
I2	$t_{w(SCLH)}$	Pulse duration, SCL high	4		μs

- (1) The capacitive load is:
100 pF in HS mode (3.4 Mbps)
400 pF in fast-speed mode (400 Kbps)
400 pF in standard mode (100 Kbps)
- (2) SDA is equal to I2C.SR.SDA or I2C.CNTL.SDA
SCL is equal to I2C.SR.SCL or I2C.CNTL.SCL
- (3) SCL low timing for slave fast-speed mode is compatible with 0.79 μs.

12.4 Audio Interface: TDM/I2S Protocol

The TPS65920/TPS65930 device acts as a master for the TDM and I2S interfaces or as a slave for only the I2S interface. If the TPS65920/TPS65930 device is the master, it must provide the frame synchronization (TDM/I2S_SYNC) and bit clock (TDM/I2S_CLK) to the host processor. If it is the slave, the TPS65920/TPS65930 device receives frame synchronization and the bit clock.

The TPS65920/TPS65930 device supports the I2S, TDM, left-justified, and right-justified data formats, but does not support TDM slave mode.

12.4.1 I2S Right- and Left-Justified Data Format

Table 12-5 and Table 12-6 assume testing over the recommended operating conditions (see Figure 12-2 and Figure 12-3).

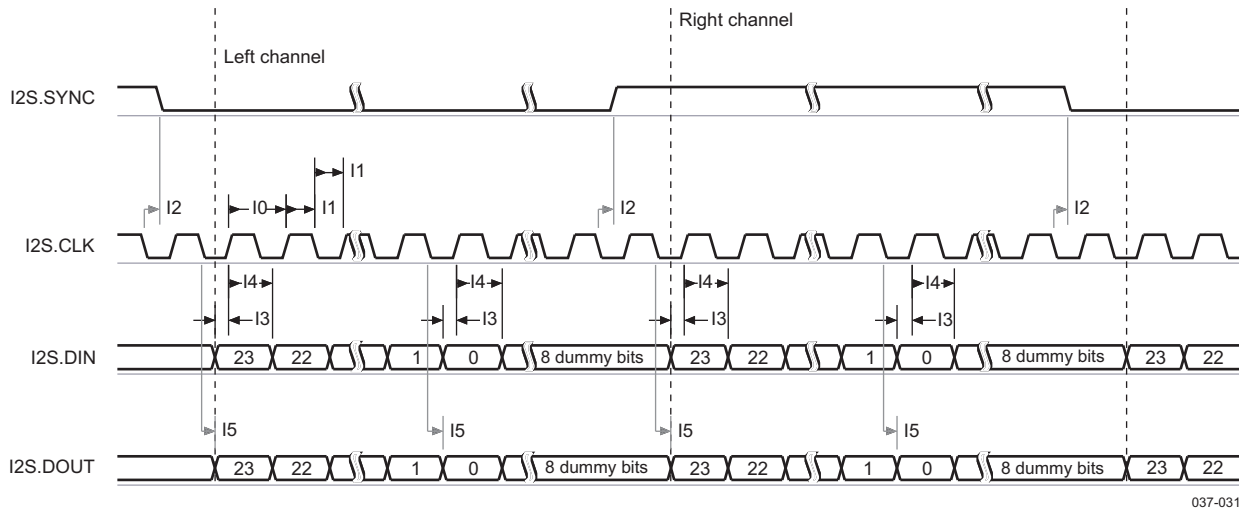

Figure 12-2. I2S Interface—I2S Master Model

Figure 12-3. I2S Interface—I2S Slave Mode

The timing requirements listed in Table 12-5 are valid on the following conditions of input slew and output load:

- Rise and fall time range of inputs (SYNC, DIN) is $t_R/t_F = 1.0 \text{ ns}/6.5 \text{ ns}$
- Capacitance load range of outputs (CLK, SYNC, DOUT) is $C_{Load} = 1 \text{ pF}/30 \text{ pF}$

The input timing requirements in [Table 12-5](#) are given by considering a rising or falling time of 6.5 ns.

Table 12-5. I2S Interface—Timing Requirements

Notation	Parameter		Min	Max	Unit
Master Mode					
I3	$t_{su}(DIN-CLKH)$	Setup time, I2S.DIN valid to I2S.CLK high ²	25		ns
I4	$t_h(DIN-CLKH)$	Hold time, I2S.DIN valid from I2S.CLK high.	0		ns
Slave Mode					
I0	$t_c(CLK)$	Cycle time, I2S.CLK ⁽¹⁾	$1/64 * F_s$		ns
I1	$t_w(CLK)$	Pulse duration, I2S.CLK high or low ⁽²⁾	$0.45 * P$	$0.55 * P$	ns
I3	$t_{su}(DIN-CLKH)$	Setup time, I2S.DIN valid to I2S.CLK high	5		ns
I4	$t_h(DIN-CLKH)$	Hold time, I2S.DIN valid from I2S.CLK high.	5		ns
I6	$t_{su}(SYNC-CLKH)$	Setup time, I2S.SYNC valid to I2S.CLK high	5		ns
I7	$t_h(SYNC-CLKH)$	Hold time, I2S.SYNC valid from I2S.CLK high	5		ns

(1) $F_s = 8$ to 48 kHz; 96 kHz for RX path only

(2) $P = I2S.CLK$ period

The capacitive load for [Table 12-6](#) is 7 pF. [Table 12-6](#) lists the switching characteristics for the I2S interface.

Table 12-6. I2S Interface—Switching Characteristics

Notation	Parameter		Min	Max	Unit
Master Mode					
I0	$t_c(CLK)$	Cycle time, I2S.CLK ⁽¹⁾	$1/64 * F_s$		ns
I1	$t_w(CLK)$	Pulse duration, I2S.CLK high or low ⁽²⁾	$0.45 * P$	$0.55 * P$	ns
I2	$t_d(CLKL-SYNC)$	Delay time, I2S.CLK falling edge to I2S.SYNC transition	-10	10	ns
I5	$t_d(CLKL-DOUT)$	Delay time, I2S.CLK falling edge to I2S.DOUT transition	-10	10	ns
Slave Mode					
I5	$t_d(CLKL-DOUT)$	Delay time, I2S.CLK falling edge to I2S.DOUT transition	0	20	ns

(1) $F_s = 8$ to 48 kHz; 96 kHz for RX path only

(2) $P = I2S.CLK$ period

12.4.2 TDM Data Format

Table 12-7 and Table 12-8 assume testing over the recommended operating conditions (see Figure 12-4).

Figure 12-4. TDM Interface—TDM Master Mode

037-030

The timing requirements listed in [Table 12-7](#) are valid on the following conditions of input slew and output load:

- Rise and fall time range of inputs (SYNC, DIN) is $t_R/t_F = 1.0 \text{ ns}/6.5 \text{ ns}$
- Capacitance load range of outputs (CLK, SYNC, DOUT) is $C_{\text{Load}} = 1 \text{ pF}/30 \text{ pF}$

Table 12-7. TDM Interface Master Mode—Timing Requirements

Notation	Parameter		Min	Max	Unit
T3	$t_{\text{su}}(\text{DIN-CLKH})$	Setup time, TDM.DIN valid to TDM.CLK high	25		ns
T4	$t_{\text{h}}(\text{DIN-CLKH})$	Hold time, TDM.DIN valid from TDM.CLK high	0		ns

[Table 12-8](#) lists the switching characteristics of the TDM interface master mode.

Table 12-8. TDM Interface Master Mode—Switching Characteristics

Notation	Parameter		Min	Max	Unit
T0	$t_{\text{c}}(\text{CLK})$	Cycle time, TDM.CLK ⁽¹⁾	$1/64 * F_s$		ns
T1	$t_{\text{w}}(\text{CLK})$	Pulse duration, TDM.CLK high or low ⁽²⁾	$0.45 * P$	$0.55 * P$	ns
T2	$t_{\text{d}}(\text{CLKL-SYNC})$	Delay time, TDM.CLK rising edge to TDM.SYNC transition	-10	10	ns
T5	$t_{\text{d}}(\text{CLKL-DOUT})$	Delay time, TDM.CLK rising edge to TDM.DOUT transition	-10	12	ns

(1) $F_s = 8$ to 48 kHz ; 96 kHz for RX path only

(2) $P = \text{TDM.CLK period}$

12.5 JTAG Interfaces

The TPS65920/TPS65930 device JTAG TAP controller handles standard IEEE JTAG interfaces. This section describes the timing requirements for the tools used to test TPS65920/TPS65930 device power management.

The JTAG/TAP module provides a JTAG interface according to IEEE Std1149.1a. This interface uses the four I/O pins TMS, TCK, TDI, and TDO. The TMS, TCK, and TDI inputs contain a pullup device, which makes their state high when they are not driven. The output TDO is a 3-state output, which is high impedance except when data are shifted between TDI and TDO.

- TCK is the test clock signal.
- TMS is the test mode select signal.
- TDI is the scan path input.
- TDO is the scan path output.

TMS and TDO are multiplexed at the top level with the GPIO0 and GPIO1 pins. The dedicated external TEST pin switches from functional mode (GPIO0/GPIO1) to JTAG mode (TMS/TDO). The JTAG operations are controlled by a state-machine that follows the IEEE Std1149.1a state diagram. This state-machine is reset by the TPS65920/TPS65930 internal power-on reset (POR). A test mode is selected by writing a 6-bit word (instruction) into the instruction register and then accessing the related data register.

[Table 12-9](#) and [Table 12-10](#) assume testing over the recommended operating conditions (see [Figure 12-5](#)).

Figure 12-5. JTAG Interface Timing

The input timing requirements are given by considering a rising or falling edge of 7 ns.

Table 12-9. JTAG Interface—Timing Requirements

Notation	Parameter		Min	Max	Unit
Clock					
JL1	$t_{c(TCK)}$	Cycle time, JTAG.TCK period	30		ns
JL2	$t_{w(TCK)}$	Pulse duration, JTAG.TCK high or low ⁽¹⁾	0.48*P	0.52*P	ns
Read Timing					
JL3	$t_{su(TDIV-TCKH)}$	Setup time, JTAG.TDI valid before JTAG.TCK high	8		ns
JL4	$t_{h(TDIV-TCKH)}$	Hold time, JTAG.TDI valid after JTAG.TCK high	5		ns
JL5	$t_{su(TMSV-TCKH)}$	Setup time, JTAG.TMS valid before JTAG.TCK high	8		ns
JL6	$t_{h(TMSV-TCKH)}$	Hold time, JTAG.TMS valid after JTAG.TCK high	5		ns

(1) P = JTAG.TCK clock period

The capacitive load is 35 pF.

Table 12-10. JTAG Interface—Switching Characteristics

Notation	Parameter		Min	Max	Unit
Write Timing					
JL7	$t_{d(TCK-TDOV)}$	Delay time, JTAG, TCK active edge to JTAG.TDO valid	0	14	ns

13 Debouncing Time

Table 13-1 lists the characteristics of debouncing.

Table 13-1. Debouncing

Debouncing Functions	Block	Programmable	Debouncing Time	Default
USB plug detection	USB	No	9x50 ms	9x50 ms
Plug/unplug detection VBUS ⁽¹⁾	USB	Yes	0 to 250 ms (32/32468-second steps)	28 ms
Plug/unplug detection ID ⁽²⁾	USB	Yes	0 to 250 ms (32/32468-second steps)	50 ms
Debouncing function interrupt generation debounce for VBUS and ID ⁽³⁾	Power	Yes	0 to 250 ms	30 ms
Hot-die detection	Thermistor	No	60 μs	60 μs
Thermal shutdown detection		No	60 μs	60 μs
PWRON ⁽⁴⁾	Start/stop button	No	31.25 ms	31.25 ms
NRESWARM	Button reset	No	60 μs	60 μs
SIM card plug/unplug	GPIO	Yes	0 or 30 ms ± 1 ms	0 ms
MMC1 (plug/unplug)	GPIO	Yes	0 or 30 ms ± 1 ms	0 ms

- (1) Programmable in the VBUS_DEBOUNCE register
- (2) Programmable in the ID_DEBOUNCE register
- (3) Programmable in the RESERVED_E[2:0] CFG_VBUSDEB register
- (4) The PWRON signal is debounced 1024*CLK32K (maximum 1026*CLK32K) falling edge in master mode.

Figure 13-1 is a sample debouncing sequence chronogram.

Figure 13-1. Debouncing Sequence Chronogram Example

Event1 is correctly debounced after 5 ms. Event2 is debounced after 50ms + dT because the capture of the event is considered after the next rising edge of the 50-ms clock.

14 External Components

Table 14-1 lists the TPS65920/TPS65930 device external components.

15 TPS65920/TPS65930 Package

15.1 TPS65920/TPS65930 Standard Package Symbols

Figure 15-1 shows the printed device reference.

Figure 15-1. Printed Device Reference

Table 15-1 lists the fields and their meanings.

Table 15-1. TPS65920/TPS65930 Nomenclature Description

Field	Meaning
P	Marking used to note prototype (X), preproduction (P), or qualified/production device (blank) ⁽¹⁾
A	Mask set version descriptor (initial silicon = BLANK, first silicon revision = A, second silicon revision = B,...) ⁽²⁾
YM	Year month
LLLLS	Lot code
\$	Fab planning code

(1) A blank in the symbol or part number is collapsed so there are no gaps between characters.

(2) Initial silicon version is ES1.0; first revision can be named ES2.0, ES1.1, or ES1.01, depending on the level of change.
Note: The device name is a maximum of 10 characters.

15.2 Package Thermal Resistance Characteristics

Table 15-2 and Table 15-3 list the thermal resistance characteristics for the TPS65920 and TPS65930 devices, respectively.

Table 15-2. TPS65920 Thermal Resistance Characteristics

$R_{\theta JA}$ (°C/W)	$R_{\theta JB}$ (°C/W)	$R_{\theta JC}$ (°C/W)	Board Type
33.40	13.80	6.74 ⁽¹⁾	2S2P ⁽²⁾
57.04	14.50	6.74 ⁽¹⁾	1S0P ⁽²⁾

(1) This measurement is not affected by the board on which the device is mounted.

(2) The board types are defined by JEDEC (reference JEDEC standard JESD51-9, Test Board for Area Array Surface Mount Package Thermal Measurements).

Table 15-3. TPS65930 Thermal Resistance Characteristics

$R_{\theta JA}$ (°C/W)	$R_{\theta JB}$ (°C/W)	$R_{\theta JC}$ (°C/W)	Board Type
33.42	13.81	6.74 ⁽¹⁾	2S2P ⁽²⁾
57.05	14.51	6.74 ⁽¹⁾	1S0P ⁽²⁾

(1) This measurement is not affected by the board on which the device is mounted.

(2) The board types are defined by JEDEC (reference JEDEC standard JESD51-9, Test Board for Area Array Surface Mount Package Thermal Measurements).

15.3 Mechanical Data

Figure 15-2 is the bottom view of the TPS65920/TPS65930 mechanical package.

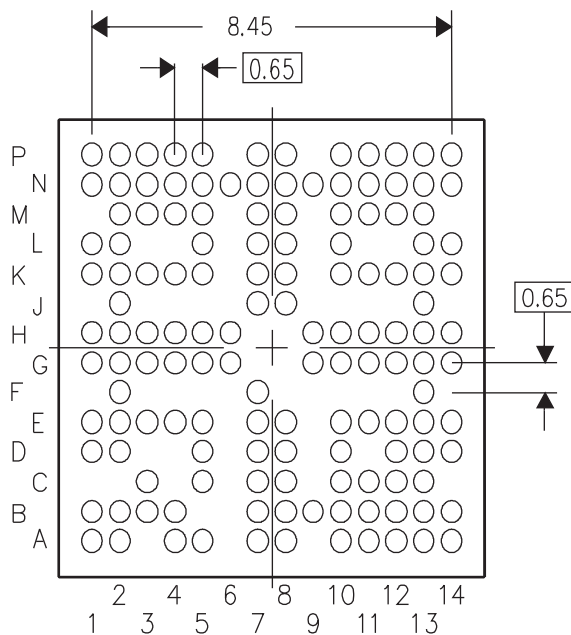

Figure 15-2. TPS65920/TPS65930 Mechanical Package Bottom View

Figure 15-3 shows the ball size.

Figure 15-3. Ball Size

15.4 ESD Specifications

The device has built-in ESD protection to the limits specified below. It is recommended that the leads are shorted together, or the device placed in conductive foam, during storage or handling to prevent electrostatic damage.

ESD Method	Standard Reference	Performance
Human Body Model (HBM)	EIA / JESD22-A114D	2000V ⁽¹⁾
Charge Device Model (CDM)	EIA / JESD22-C101C	500V

(1) The pin CLK32KOUT is 1500V HBM compliant.

16 Glossary

ADC	Analog-to-digital converter
ALC	Automatic level control
ASIC	Application-specific integrated circuit
BGA	Ball grid array
BW	Signal bandwidth
CMOS	Complementary metal oxide semiconductor
CMT	Cellular mobile telephone
CPU	Central processing unit
DAC	Digital-to-analog converter
DBB	Digital baseband
DCR	Data capture record
DM	Data manual
DSP	Digital signal processor
DVFS	Dynamic voltage and frequency scaling
ESD	Electrostatic discharge
ESR	Equivalent series resistance
FET	Field effect transistor
FS	Full speed
FSR	Full-scale range
GND	Ground
GP	General-purpose
GPIO	General-purpose input/output
hiZ	High impedance
HS	High speed or high security
HW	Hardware
I ² C	Inter-integrated circuit
I2S	Inter IC sound
IC	Integrated circuit
ICN	Idle channel noise
ID	Identification
IDDQ	Direct drain quiescent current
IF	Interface
IO or I/O	Input/output
JTAG	Joint Test Action Group, IEEE 1149.1 standard
LDO	Low-dropout regulator
LED	Light-emitting diode
LJF	Left-justified format
LS	Low speed
MADC	Monitoring analog-to-digital converter

MMC	Multimedia card
NA, N/A	Not applicable
NRZI	Nonreturn to zero inverted
OCP	Open-core protocol
OTG	On-the-Go
PBGA	Plastic ball grid array
PCB	Printed circuit board
PD	Pulldown
PDM	Pulse density modulated
PFM	Pulse frequency modulation
PLL	Phase-locked loop
POL	Polarity
POR	Power-on reset
PSR	Power-supply rejection
PSRR	Power-supply rejection ratio
PU	Pullup
PWL	Pulse-width length
PWM	Pulse-width modulation
PWT	Pulse-width time
RJF	Right-justified format
RTC	Real-time clock
RX	Receive
SDI	Serial display interface
SMPS	Switch-mode power supplies
SNR	Signal-to-noise ratio
SW	Software
SYNC/SYNCHRO	Synchronization
SYS	System
TBD	To be defined
THRU	Feed through
TRM	Technical reference manual
TX	Transmit
UART	Universal asynchronous receiver/transmitter
ULPI	UTMI+ low pin Interface
UPR	Uninterrupted power rail
USB	Universal serial bus
UTMI	USB transceiver macrocell Interface

PACKAGING INFORMATION

Orderable Device	Status ⁽¹⁾	Package Type	Package Drawing	Pins	Package Qty	Eco Plan ⁽²⁾	Lead/ Ball Finish	MSL Peak Temp ⁽³⁾	Samples (Requires Login)
TPS65920BZCH	ACTIVE	NFBGA	ZCH	139	184	Green (RoHS & no Sb/Br)	SNAGCU	Level-3-260C-168 HR	Request Free Samples
TPS65920BZCHR	ACTIVE	NFBGA	ZCH	139	1000	Green (RoHS & no Sb/Br)	SNAGCU	Level-3-260C-168 HR	Purchase Samples
TPS65930BZCH	ACTIVE	NFBGA	ZCH	139	184	Green (RoHS & no Sb/Br)	SNAGCU	Level-3-260C-168 HR	Request Free Samples
TPS65930BZCHR	ACTIVE	NFBGA	ZCH	139	1	Green (RoHS & no Sb/Br)	SNAGCU	Level-3-260C-168 HR	Purchase Samples

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

ZCH (S-PBGA-N139)

PLASTIC BALL GRID ARRAY

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. nFBGA configuration
 - D. This is a lead-free solder ball design.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
