Table 2(b): Pin Assignment

Pin No.	Symbol	Description
16	D7	This is an 8-bit bi-directional data bus that connects to an 8-bit standard MPU data bus. When the serial interface is selected (P/S = LOW), then D7 serves as the serial data input terminal (SI) and D6 serves as the serial clock input terminal (SCL). At this time, D0 to D5 are set to high impedance. When the chip select is inactive, D0 to D7 are set to high impedance.
17	D6	
18	D5	
19	D4	
20	D3	
21	D2	
22	D1	
23	D0	
24	E($\overline{RD}$)	When connected to an 8080 MPU, this is active LOW. This pin is connected to the $\overline{RD}$ signal of the 8080 MPU, and the S1D15605 series data bus is in an output status when this signal is LOW. When connected to a 6800 Series MPU, this is active HIGH. This is the 6800 Series MPU enable clock input terminal.
25	R/W($\overline{WR}$)	When connected to an 8080 MPU, this is active LOW. This terminal connects to the 8080 MPU $\overline{WR}$ signal. The signals on the data bus are latched at the rising edge of the $\overline{WR}$ signal. When connected to an 6800 Series MPU: This is the read/write control signal input terminal. When R/$\overline{W}$ = HIGH: Read. When R/$\overline{W}$ = LOW: Write.
26	D/C	This is connect to the least significant bit of the normal MPU address bus, and it determines whether the data bits are data or a command. D/C(A0)="High": Indicates that D0 to D7 are display data. D/C(A0)="Low": Indicates that D0 to D7 are control data.
27	$\overline{CS1}$	This is the chip select signal for first chip. When $\overline{CS1}$=LOW and CS2=HIGH, then the chip select becomes active and the data/commands I/O is enabled.
28	$\overline{RES}$	When $\overline{RES}$ is set to LOW, the settings are initialized. The reset operation is performed by the $\overline{RES}$ signal level.
-	A	Anode of backlight.
-	K	Cathode of backlight.

3. STATIC ELECTRICITY AND SURGE

* Static electricity and surge will damage the LEDs. It is recommended to use a wrist band or anti-electrostatic glove when handling the LEDs.
* All devices, equipment and machinery must be properly grounded.
* When inspecting own final products on which LEDs were mounted, it is recommended to check also whether the mounted LEDs are damaged by static electricity or not. It is easy to find static-dimaged LEDs by light emission test at lower current (below 1mA is recommended). Damaged LEDs will show some unusual characteristics such as leak current remarkably increases, starting forward voltage becomes lower, or the LEDs get unlighted at the low current.

4. RECOMMEND CONNECTION OF STATIC-ELECTRICITY RESISTANCE

* This circuit diagram is a common ESD protection circuit for all super bright blue,white and green color LED backlight application.
